## Copyrights

© Cypress Semiconductor Corporation, 2014-2017. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.

CySmart, F-RAM, Programmable System-on-Chip, and PSoC Creator are trademarks, and PSoC and CapSense are registered trademarks of Cypress Semiconductor Corporation. All other products and company names mentioned in this document may be the trademarks of their respective holders.

Purchase of I<sup>2</sup>C components from Cypress or one of its sublicensed Associated Companies conveys a license under the Philips I<sup>2</sup>C Patent Rights to use these components in an I<sup>2</sup>C system, provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips. As from October 1st, 2006 Philips Semiconductors has a new trade name - NXP Semiconductors.

## Flash Code Protection

Cypress products meet the specifications contained in their particular Cypress Datasheets. Cypress believes that its family of products is one of the most secure families of its kind on the market today, regardless of how they are used. There may be methods, unknown to Cypress, that can breach the code protection features. Any of these methods, to our knowledge, would be dishonest and possibly illegal. Neither Cypress nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Cypress is willing to work with the customer who is concerned about the integrity of their code. Code protection is constantly evolving. We at Cypress are committed to continuously improving the code protection features of our products.

# Safety Information

The CY8CKIT-042-BLE Bluetooth® Low Energy (BLE) Pioneer Kit is intended for use as a development platform for hardware or software in a laboratory environment. The board is an open system design, which does not include a shielded enclosure. Therefore, the board may cause interference with other electrical or electronic devices in close proximity.

In a domestic environment, this product may cause radio interference. In such cases, the user should take adequate preventive measures. Also, this board should not be used near any medical equipment or critical RF devices. The kit is not intended for general consumer use. Cypress recommends that the kit only be used in a shielded room.

Attaching additional wiring to this product or modifying the product operation from the factory default may affect its performance and cause interference with other apparatus in the immediate vicinity. If such interference is detected, suitable mitigating measures should be taken.

The CY8CKIT-042-BLE, as shipped from the factory, has been verified to meet with the requirements of CE as a Class A product.

CY8CKIT-042-BLE boards contain ESD-sensitive devices. Electrostatic charges readily accumulate on the human body and any equipment, and can discharge without detection. Permanent damage may occur on devices subjected to high-energy discharges. Proper ESD precautions are recommended to avoid performance degradation or loss of functionality. Store unused CY8CKIT-042-BLE boards in the protective shipping package.

## End-of-Life/Product Recycling

The end-of-life cycle for this kit is five years from the date of manufacture mentioned on the back of the box. Contact your nearest recycler to discard the kit.

## General Safety Instructions

### ESD Protection

ESD can damage boards and associated components. Cypress recommends that the user perform procedures only at an ESD workstation. If an ESD workstation is not available, use appropriate ESD protection by wearing an antistatic wrist strap attached to the chassis ground (any unpainted metal surface) on the board when handling parts.

### Handling Boards

CY8CKIT-042-BLE boards are sensitive to ESD. Hold the board only by its edges. After removing the board from its box, place it on a grounded, static-free surface. Use a conductive foam pad if available. Do not slide the board over any surface.

### Battery Care and Use

- Use the correct size and type of battery specified in this guide.
- Keep battery contact surfaces and battery compartment contacts clean by rubbing them with a clean pencil eraser or a rough cloth each time you replace batteries.
- Remove the battery from a device when it is not expected to be in use for several months.
- Make sure that you insert the battery into your device properly, with the + (plus) and – (minus) terminals aligned correctly.
- Do not place the battery next to metallic objects such as keys and coins.
- Never throw the battery into fire.
- Do not open up the battery.
- Do not short the battery.
- Do not subject the battery to high temperatures or high humidity.
- Store the battery in a dry place.
- Do not recharge a battery unless it is marked “rechargeable.”

### Battery Disposal

Batteries can be safely disposed with normal household waste. Never dispose batteries in fire because they can explode. It is important not to dispose large amounts of batteries in a group. Used batteries are often not completely “dead.” Grouping used batteries together can bring these “live” batteries into contact with one another, creating safety risks.

## Regulatory Compliance Information

The CY8CKIT-042-BLE kit contains devices that transmit and receive radio signals in accordance with the spectrum regulations for the 2.4-GHz unlicensed frequency range.

Cypress Semiconductor Corporation has obtained regulatory approvals for this kit to be used in specific countries. These countries include the United States (FCC Part 15), Canada (IC RSS210), and Japan (JRF/TELEC). Additional regional regulatory agency approval may be required to operate these throughout the world.

This kit, as shipped from the factory, has been tested and found to comply with the limits and requirements for the following compliances:

- As a Class B digital device, pursuant to part 15 of the FCC Rules.
- As a Class B digital apparatus, compliant with Canadian ICES-003.

## Regulatory Statements and Product Labeling

### *United States (FCC)*

The CY8CKIT-142 PSoC 4 BLE and CY5677 PRoC BLE modular transmitter complies with Part 15 of the Federal Communications Commission (FCC) Rules. The FCC ID for these devices are **WAP-CY8CKIT-142** for CY8CKIT-142 and **WAP-CY5677** for CY5677.

Operation is subject to the following two conditions:

- This device may not cause harmful interference
- This device must accept any interference received, including interference that may cause undesired operation.

**CAUTION:** Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment. The antennas for this transmitter must be installed to provide a separation distance of 20 cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter.

### *Canada (IC)*

This device complies with the Industry Canada license-exempt RSS standard(s). Operation is subject to the following two conditions:

- This device may not cause interference.

- This device must accept any interference, including interference that may cause undesired operation of the device.

This equipment complies with radio frequency exposure limits set forth by Industry Canada for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20 cm between the device and the user or bystanders.

CAUTION: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Contains IC: **CY8CKIT-142** and **CY5677**

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes: (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Cet équipement est conforme aux limites d'exposition aux radiofréquences définies par Industrie Canada pour un environnement non contrôlé. Cet équipement doit être installé et utilisé avec un minimum de 20cm de distance entre le dispositif et l'utilisateur ou des tiers.

Contains IC: **CY8CKIT-142** and **CY5677**

*Japan (TELEC)*

**CY8CKIT-142**

Manufactured by Cypress Semiconductor.

R 005-100919

**CY5677**

Manufactured by Cypress Semiconductor.

R 203-JN0581

# 1. Introduction

Thank you for your interest in the CY8CKIT-042-BLE Bluetooth® Low Energy (BLE) Pioneer Kit. The BLE Pioneer Kit enables customers to evaluate and develop BLE projects using the PSoC® 4 BLE device.

Bluetooth SMART™ or Bluetooth Low Energy (BLE) is a full-featured, layered, communication protocol that includes a 2.4-GHz radio, a link layer, and an application layer. However, you do not need to understand the complex protocol to implement your projects using PSoC 4 BLE. The Cypress BLE solution, which includes the device, the BLE Component, and the BLE firmware stack will take care of it for you. The Cypress BLE firmware stack is royalty free.

You will use two software tools, PSoC Creator™ and CySmart™ Central Emulation Tool, to develop and debug your BLE project. PSoC Creator is Cypress' standard integrated design environment (IDE). The BLE protocol has been abstracted into an easy drag-and-drop BLE Component in PSoC Creator. The CySmart Central Emulation Tool is a host tool for Windows PCs, which provides an easy-to-use GUI to enable customers to test and debug their BLE projects.

The BLE Pioneer Kit offers footprint-compatibility with Arduino™ shields as well as 6-pin Digilent® Pmod™ daughter cards. In addition, the kit features a CapSense® slider, an RGB LED, a push-button switch, an onboard programmer/debugger and the USB-UART/I<sup>2</sup>C bridge functionality block (KitProg), a coin cell battery holder, and a Cypress F-RAM™. The BLE Pioneer Kit supports 1.9 V, 3 V, 3.3 V, or 5 V as operating voltages. The BLE Pioneer Kit supports the PSoC4 BLE device which is a 32-bit, 48-MHz ARM® Cortex®-M0 BLE solution with CapSense, 12-bit analog front end (1x SAR ADC, 4x low-power opamps, 2x low-power comparators, and 2x current DACs), 4x TCPWM<sup>1</sup>, 2x SCBs<sup>2</sup>, 4x UDBs<sup>3</sup>, LCD<sup>4</sup>, I<sup>2</sup>S<sup>5</sup>, and 36 GPIOs. PSoC 4 BLE provides a complete solution for sports and fitness monitors, wearable electronics, medical devices, home automation systems, and sensor-based low-power systems for the Internet of Things (IoT).

The PSoC 4 BLE is available in 128KB and 256KB flash configurations.

The PSoC 4 BLE is supported by royalty-free protocol stacks compatible with Bluetooth 4.1 and Bluetooth 4.2.

- 
1. Configurable timer, counter, and pulse-width modulator.
  2. Serial communication blocks (configurable to I<sup>2</sup>C, SPI, or UART).
  3. Universal digital blocks
  4. Configurable liquid crystal display driver.
  5. Configurable integrated interchip sound serial bus interface.

## 1.1 Kit Contents

The BLE Pioneer Kit contains the following items (see [Figure 1-1](#)):

- BLE Pioneer Baseboard preloaded with the CY8CKIT-142 PSoC 4 BLE Module
- CY5677 CySmart BLE 4.2 USB Dongle (BLE Dongle)
- Quick start guide
- USB Standard-A to Mini-B cable
- Four jumper wires (4 inch) and two proximity sensor wires (5 inch)
- Coin cell (3-V CR2032)

Figure 1-1. Kit Contents

The BLE Modules that are shipped as part of the BLE Pioneer Kit support 128KB flash and Bluetooth 4.1. The BLE Modules that support 256KB flash and Bluetooth 4.2 can be ordered separately. For more information about these modules, refer to [BLE Modules and BLE Dongles Compatible with the BLE Pioneer Kit on page 125](#).

If any part of the BLE Pioneer Kit is missing, contact your nearest Cypress sales office for help: [www.cypress.com/go/support](http://www.cypress.com/go/support).

## 1.2 BLE Pioneer Baseboard Details

The BLE Pioneer Baseboard consists of the blocks shown in [Figure 1-2](#).

1. RGB LED
2. BLE device reset button
3. CapSense proximity header
4. User button
5. CapSense slider
6. Arduino-compatible I/O headers (J2/J3/J4)
7. Arduino-compatible power header (J1)
8. Digilent Pmod-compatible I/O header (J5)
9. Cypress F-RAM 1 Mb (FM24V10-G)
10. PSoC 5LP I/O header (J8)
11. PSoC 5LP programmer and debugger (CY8C5868LTI-LP039)
12. Coin cell holder (bottom side)
13. USB connector (J13)
14. Power LED and Status LED
15. System power supply jumper (J16) - LDO 1.9 V~5 V
16. BLE power supply jumper / current measurement (J15)
17. BLE module headers (J10/J11)

Figure 1-2. BLE Pioneer Baseboard

Figure 1-3 shows a markup of the onboard components of the PSoC 4 BLE module. See [BLE Modules and BLE Dongles Compatible with the BLE Pioneer Kit](#) on page 125 for more details. Figure 1-4 shows the BLE Dongle board blocks.

Figure 1-3. BLE Module Markup

Figure 1-4. BLE Dongle Markup

## 1.3 PSoC Creator

PSoC Creator™ is a state-of-the-art, easy-to-use integrated design environment (IDE). It introduces revolutionary hardware and software co-design, powered by a library of pre-verified and pre-characterized PSoC Components. With PSoC Creator, you can:

1. Drag and drop Components to build your hardware system design in the main design workspace
2. Codesign your application firmware with the PSoC hardware
3. Configure Components using configuration tools
4. Explore the library of 100+ Components
5. Review Component datasheets

Figure 1-5. PSoC Creator Features

PSoC Creator also enables you to tap into an entire tool ecosystem with integrated compiler chains and production programming programmers for PSoC devices.

For more information, visit [www.cypress.com/psoccreator](http://www.cypress.com/psoccreator). Visit [PSoC Creator training page](#) for video tutorials on learning and using PSoC Creator.

### 1.3.1 PSoC Creator Code Examples

PSoC Creator includes a large number of code examples. These examples are available from the PSoC Creator Start Page, as [Figure 1-6](#) shows.

Code examples can speed up your design process by starting you off with a complete design, instead of a blank page. The code examples also show how PSoC Creator Components can be used for various applications. Code examples and documentation are included, as shown in [Figure 1-7 on page 16](#).

In the **Find Example Project** dialog shown in [Figure 1-7](#), you have several options:

- Filter for examples based on architecture or device family, that is, PSoC 3, PSoC 4 or PSoC 5LP; project name; or keyword.
- Select from the menu of examples offered based on the **Filter Options**.
- Review the example project's description (on the **Documentation** tab).
- Review the code from the **Sample Code** tab. You can copy the code from this window and paste to your project, which can help speed up code development.
- Create a new project (and a new workspace if needed) based on the selection. This can speed up your design process by starting you off with a complete, basic design. You can then adapt that design to your application.

Figure 1-6. Code Examples in PSoC Creator

Figure 1-7. Code Example Projects with Sample Code

### 1.3.2 Kit Code Examples

This kit includes a number of code examples, which can be used to quickly evaluate the functionality of this kit. These examples are described in the [Example Projects chapter on page 37](#).

If you are a beginner in BLE, refer to the PSoC Creator code examples such as `BLE_FindMe` and `BLE_Device_Information_Service` as pointed out in section 1.3.1. You may also refer the application note [Getting Started with PSoC 4 BLE](#).

The four Kit code examples viz CapSense Slider and LED, CapSense Proximity, BLE Central Mode and Eddystone are intermediary level examples that will help to design a system around the kit. Refer to the [4.2 CapSense Slider and LED](#) and later for details.

The CySmart Dongle code example is an advanced level example that will demonstrate a complete solution around the kit. Refer to [4.6 BLE Dongle and LED Control](#) for details.

### 1.3.3 PSoC Creator Help

Visit the [PSoC Creator home page](#) to download the latest version of PSoC Creator. Then, launch PSoC Creator and navigate to the following items:

- **Quick Start Guide:** Choose **Help > Documentation > Quick Start Guide**. This guide gives you the basics for developing PSoC Creator projects.
- **Simple Component example projects:** Choose **File > Code Example**. These example projects demonstrate how to configure and use PSoC Creator Components.
- **System Reference Guide:** Choose **Help > System Reference Guide**. This guide lists and describes the system functions provided by PSoC Creator.
- **Component datasheets:** Right-click a Component and select **Open Datasheet**, as shown in [Figure 1-8](#). Visit the [PSoC 4 Component Datasheets](#) page for a list of all PSoC 4 Component datasheets.
- **Document Manager:** PSoC Creator provides a document manager to help you to easily find and review document resources. To open the document manager, choose the menu item **Help > Document Manager**.

### 1.3.4 Component Datasheets

Right-click a Component and select **Open Datasheet** (see [Figure 1-8](#)).

Figure 1-8. Opening Component Datasheet

## 1.4 Getting Started

This guide will help you get acquainted with the BLE Pioneer Kit:

- The [Software Installation chapter on page 21](#) describes the installation of the kit software. This includes the PSoC Creator IDE for development and debugging applications, PSoC Programmer for programming hex files, and the CySmart Central Emulation Tool for BLE Central emulation.
- The [Kit Operation chapter on page 25](#) describes the major features of the BLE Pioneer Kit such as USB-UART and USB-I<sup>2</sup>C bridges and functionalities such as programming and debugging.
- The [Example Projects chapter on page 37](#) describes multiple PSoC 4 BLE code examples that will help you understand how to create your own BLE application using the BLE Component and device.
- The [Hardware chapter on page 86](#) details the hardware content of the BLE Pioneer Kit and BLE Dongle, and the hardware operation.
- The [Advanced Topics chapter on page 113](#) explains the functionality of FM24V10 F-RAM.
- The [Appendix on page 115](#) provides the bill of materials (BOM), KitProg LED states, list of BLE modules and dongles compatible with the BLE Pioneer Kit, migrating projects across Pioneer series kits, and programming BLE modules using MiniProg3.

## 1.5 Additional Learning Resources

Cypress provides a wealth of information at [www.cypress.com](http://www.cypress.com) to help you to select the right PSoC device for your design, and to help you to quickly and effectively integrate the device into your design. For a comprehensive list of resources, see [KBA86521, How to Design with PSoC 3, PSoC 4, and PSoC 5LP](#).

Visit [www.cypress.com/go/psoc4ble](http://www.cypress.com/go/psoc4ble) and [www.cypress.com/procble](http://www.cypress.com/procble) for additional learning resources including datasheets, technical reference manuals, and application notes. The following is an abbreviated list:

- Overview: [PSoC 4 BLE Portfolio](#) and [PSoC Roadmap](#)
- Product Selectors: [PSoC 1](#), [PSoC 3](#), [PSoC 4](#), or [PSoC 5LP](#). In addition, [PSoC Creator](#) includes a device selection tool.
- [Datasheets](#): Describe and provide electrical specifications for the PSoC 4 device family
- [CapSense Design Guide](#): Learn how to design capacitive touch-sensing applications with the PSoC 4 family of devices.
- [Application Notes and Code Examples](#): Cover a broad range of topics, from basic to advanced level. Many of the application notes include code examples. Visit the [PSoC 3/4/5 Code Examples](#) webpage for a list of all available PSoC Creator code examples. To access code examples from within PSoC Creator, see [PSoC Creator Code Examples on page 15](#).
- [Technical Reference Manuals \(TRM\)](#): Provide detailed descriptions of the architecture and registers in each PSoC 4 device family.
- [Development Kits](#):
  - [CY8CKIT-040](#), [CY8CKIT-042](#), and [CY8CKIT-044](#) are easy-to-use and inexpensive development platforms. These kits include connectors for Arduino-compatible shields and Digilent Pmod peripheral modules.
  - [CY8CKIT-141](#), [CY8CKIT-143](#), and [CY8CKIT-143A](#) are additional BLE Modules compatible with the BLE Pioneer Kit.
  - [CY8CKIT-049](#) is a very low-cost prototyping platform for PSoC 4100/4200 families.
  - The [MiniProg3](#) kit provides an interface for flash programming and debug.
- [Knowledge Base Articles \(KBA\)](#): Provide design and application tips from experts on using the device.
- PSoC Creator Training: Visit [www.cypress.com/go/creatorstart/creatortraining](http://www.cypress.com/go/creatorstart/creatortraining) for a comprehensive list of video trainings on PSoC Creator.
- Cysmart Central Emulation Tool: Visit [www.cypress.com/go/cysmart](http://www.cypress.com/go/cysmart) for information on the CySmart Central Emulation Tool.
- Learning From Peers: Visit [www.cypress.com/forums](http://www.cypress.com/forums) to meet enthusiastic PSoC developers discussing the next generation embedded systems on Cypress Developer Community Forums.

### 1.5.1 Bluetooth Learning Resources

The [Bluetooth Developer Portal](#) provides material by the Special Interest Group (SIG) for learning various aspects of the Bluetooth Low Energy protocol and systems. Some of them are:

- [Training videos](#)
- [GATT profiles](#)
- [Bluetooth community forum](#)

### 1.5.2 Other Related Resources

- Digilent Pmod: [www.digilentinc.com/pmods/](http://www.digilentinc.com/pmods/)
- Arduino: <http://arduino.cc/en/Main/ArduinoBoardUno>

## 1.6 Technical Support

If you have any questions, our technical support team is happy to assist you. You can create a support request on the [Cypress Technical Support](#) page.

If you are in the United States, you can talk to our technical support team by calling our toll-free number: +1-800-541-4736. Select option 2 at the prompt.

You can also use the following support resources if you need quick assistance.

- [Self-help](#)
- [Local Sales Office Locations](#)

## 1.7 Documentation Conventions

Table 1-1. Document Conventions for Guides

Convention	Usage
Courier New	Displays file locations, user entered text, and source code: C:\...\cd\icc\
<i>Italics</i>	Displays file names and reference documentation: Read about the <i>sourcefile.hex</i> file in the <i>PSoC Creator User Guide</i> .
[Bracketed, Bold]	Displays keyboard commands in procedures: [Enter] or [Ctrl] [C]
File > Open	Represents menu paths: File > Open > New Project
<b>Bold</b>	Displays commands, menu paths, and icon names in procedures: Click the <b>File</b> icon and then click <b>Open</b> .
Times New Roman	Displays an equation: 2 + 2 = 4
Text in gray boxes	Describes cautions or unique functionality of the product.

## 1.8 Acronyms

Table 1-2. Acronyms Used in this Document

Acronym	Definition
ADC	analog-to-digital converter
API	application programming interface
BD address	Bluetooth device address
BLE	Bluetooth Low Energy
CDC	Communications Device Class
COM	communication port
DLE	data length extension
ECDH	Elliptic Curve Diffie-Hellman
DVD	digital video disc

Table 1-2. Acronyms Used in this Document (*continued*)

Acronym	Definition
ESD	electrostatic discharge
F-RAM	ferroelectric random access memory
GATT	generic attribute profile
GUI	graphical user interface
GPIO	general-purpose input/output
I <sup>2</sup> C	inter-integrated circuit
IAS	immediate alert service
IDAC	current output digital-to-analog converter
IDE	integrated development environment
LDO	low drop out (voltage regulator)
LE	low energy
LED	light-emitting diode
LP	low power
LPT	line print terminal
MTU	maximum transmission unit
OTA	over-the-air
PHY	physical layer
PrISM	Precise Illumination Signal Modulation
PSM	protocol service multiplexer
PSoC	Programmable System-on-Chip
PWM	pulse width modulation
QFN	quad flat no-lead (package)
RDK	reference design kit
RGB	red green blue
SAR	successive approximation register
SIG	special interest group
SMA	SubMiniature version A
SPI	serial peripheral interface
SWD	serial wire debug
TLM	telemetry
UART	universal asynchronous receiver transmitter
UID	universal identifier
URI	uniform resource identifier
URL	uniform resource locator
USB	Universal Serial Bus
UUID	universal unique identifier

## 2. Software Installation

This chapter describes the steps to install the software tools and packages on a computer for using the BLE Pioneer Kit. This includes the IDE in which the projects will be built and used for programming.

### 2.1 Before You Begin

All Cypress software installations require administrator privileges. Ensure you have the required privileges on the system for successful installation. Before you install the kit software, close any other Cypress software that is currently running.

### 2.2 Install Software

Follow these steps to install the BLE Pioneer Kit software:

1. Download the kit software from [www.cypress.com/CY8CKIT-042-BLE](http://www.cypress.com/CY8CKIT-042-BLE). The software is available in the following formats:
  - a. CY8CKIT-042-BLE Kit Complete Setup: This installation package contains the files related to the BLE Pioneer Kit. However, it does not include the Windows Installer or Microsoft .NET framework packages. If these packages are not on your computer, the installer directs you to download and install them from the Internet.
  - b. CY8CKIT-042-BLE Kit Only Package: This executable file installs only the BLE Pioneer Kit contents, which include code examples, hardware files, and user documents. This package can be used if all the software prerequisites (listed in step 5) are installed on your computer.
  - c. CY8CKIT-042-BLE DVD ISO: This file is a complete package, stored in a DVD-ROM image format, that you can use to create a DVD or extract using an ISO extraction program such as WinZip or WinRAR. The file can also be mounted similar to a virtual CD/DVD using virtual drive programs such as 'Virtual CloneDrive' and 'MagicISO'. This file includes all the required software, utilities, drivers, hardware files, and user documents.
2. If you have downloaded the ISO file, mount it on a virtual drive; if you do not have a virtual drive to mount, extract the ISO contents using the appropriate ISO extractor (such as MagicISO or PowerISO). Double-click **cyautorun.exe** in the root directory of the extracted content or mounted ISO if "Autorun from CD/DVD" is not enabled on the computer. The installation window will appear automatically.

**Note:** If you are using the "Kit Complete Setup" or "Kit Only Package" file, then go to step 4 for installation.

3. Click **Install CY8CKIT-042-BLE Kit** to start the installation, as shown in [Figure 2-1](#).

Figure 2-1. Installer Screen

4. Select the folder in which you want to install the CY8CKIT-042-BLE kit-related files. Choose the directory and click **Next**.
5. When you click **Next**, the CY8CKIT-042-BLE Kit installer automatically installs the required software, if it is not present on your computer. The following software packages are required:  
**Note:** For the Kit Only Package, download and install the following prerequisites.
  - a. PSoC Creator 4.1 or later: Download the latest version from [www.cypress.com/psoccreator](http://www.cypress.com/psoccreator).
  - b. PSoC Programmer 3.26 or later: This is installed as part of PSoC Creator installation ([www.cypress.com/programmer](http://www.cypress.com/programmer)).
  - c. CySmart 1.2 SP1 or later: Download the latest version from [www.cypress.com/cysmart](http://www.cypress.com/cysmart).

6. Choose the Typical/Custom/Complete installation type in the **Product Installation Overview** window, as shown in [Figure 2-2](#). Click **Next** after you select the installation type.

Figure 2-2. Product Installation Overview

7. Read the license agreement and select **I accept the terms in the license agreement** to continue with installation. Click **Next**.
  8. When the installation begins, a list of packages appears on the installation page. A green check mark appears next to each package after successful installation.
  9. Click **Finish** to complete the CY8CKIT-042-BLE kit installation.
  10. Enter your contact information or select the **Continue Without Contact Information** check box. Click **Finish** to complete the CY8CKIT-042-BLE kit installation.
  11. After the installation is complete, the kit contents are available at the following location:

<Install Directory>\CY8CKIT-042-BLE Kit

Default location:

Windows 7 (64-bit)

Windows 7 (32 bit); C:\Program Files\GIMP-2.8\GIMPKIT-242.PIEKit

**Note:** For Windows 7/8/8.1 users, the installed files and the folder are read-only.

The BLE Beacon Kit includes a project file for the G-Sensor Configuration Task. To learn more about how to use the kit, the rest of this guide is read-only. To see the latest example projects, follow the steps outlined in the [Example Projects chapter on page 37](#).

The BLE Pioneer Kit includes a USB Dongle and the CySmart Central Emulation Tool on your computer. This software, along with the BLE Dongle, allows the computer to emulate as a BLE Central device.

## 2.3 Windows 8.1 and Windows 10 USB Selective Suspend Setting

The Windows 8.1 and Windows 10 operating systems issue a suspend command to a connected USB device if there is no activity on its USB bus. This may happen to the BLE Pioneer Kit/BLE Dongle if the driver installation is not complete or the driver is not found. In this situation, as a response to the suspend command from the operating system, the KitProg will shut down the onboard LDO to remain within the USB suspend current requirement. Due to this, the BLE Pioneer Kit will not be powered and will not be functional.

To prevent this, do either of the following:

- Install the kit software on the Windows 8.1 or Windows 10 operating system before using the BLE Pioneer Kit.
- Disable the USB selective suspend setting for the BLE Pioneer Kit from Power Options on Windows 8.1, by following these steps:
  - a. From **Control Panel**, go to **Power Options**.
  - b. Click **Change Plan Settings** corresponding to your power plan.
  - c. Click **Change Advanced Power Settings**.
  - d. Under Advanced settings, expand **USB Settings > USB selective suspend setting**.
  - e. Select the **Disabled** option for **Plugged in** and **On battery** operation.
  - f. Click **OK**.

# 3. Kit Operation

This chapter introduces you to the BLE Pioneer Kit and the features that will be used as part of its operation. We will discuss features such as USB connection, programming/debugging, and programmer firmware update. The chapter also describes the USB-UART and USB-I<sup>2</sup>C bridges along with the PC tools that can be used to communicate with the BLE device on the BLE Pioneer Kit.

## 3.1 Theory of Operation

[Figure 3-1](#), [Figure 3-2](#), and [Figure 3-3](#) show the block diagrams for the BLE Pioneer Baseboard, PSoC 4 BLE Module, and BLE Dongle.

Figure 3-1. BLE Pioneer Baseboard Block Diagram

The BLE Pioneer Baseboard acts as the baseboard for the PSoC 4 BLE Module. The BLE Pioneer Baseboard contains a PSoC 5LP device, that has KitProg firmware, used as an onboard programmer or debugger, and for the USB-Serial interface.

The baseboard is Arduino form-factor compatible, enabling Arduino shields to be connected on top of the board to extend the functionality of the PSoC 4 BLE Module. The board also features a 1-Mb F-RAM, an RGB LED, a five-segment CapSense slider, a proximity header, a user switch, and a reset switch for the PSoC 4 BLE device on the module. The BLE Pioneer Baseboard supports three voltage levels: 1.9 V, 3.3 V, and 5 V.

The BLE Pioneer Baseboard can also be used as a standalone programmer to program and debug other BLE devices using SWD, and as a USB-Serial interface. The KitProg firmware on PSoC 5LP device enables bootloading PSoC 4 LP over USB to upgrade the firmware.

Figure 3-2. PSoC 4 BLE Module Block Diagram

This BLE Pioneer Kit includes the PSoC 4 BLE Module. This module act as a basic breakout board for the CY8C4247LQI-BL483 (PSoC 4 BLE) device. Besides the PSoC4 BLE Module, there are additional modules available, which can be ordered separately. The complete list is available in [BLE Modules and BLE Dongles Compatible with the BLE Pioneer Kit on page 125](#).

The BLE Dongle is the wireless interface for the CySmart Central Emulation Tool. It has a PRoC BLE device for BLE communication and KitProg for onboard programming, debugging, and for the USB-Serial interface, as shown in Figure 3-3.

The BLE Dongle has a USB Type-A plug to connect the KitProg to the USB port of the host computer. The KitProg then communicates with the PRoC BLE device over UART or multiplexed I<sup>2</sup>C or an SPI bus. The BLE Dongle also features a user LED, a user switch, and a reset switch for the PRoC BLE device. The dongle is powered directly through the USB port (VBUS) at 5.0 V.

Figure 3-3. BLE Dongle Block Diagram

## 3.2 KitProg

KitProg is the hardware/firmware block for onboard programming, debugging, and bridge functionality. It is a common reusable hardware/firmware block used across many Cypress kit platforms. It consists of a PSoC 5LP, which connects to the computer over an USB interface and connects to the PSoC 4 BLE device over SWD, I<sup>2</sup>C, and UART pins.

The KitProg communicates with PSoC Programmer and PSoC Creator software to program/debug the target PSoC 4 BLE over the SWD interface. The main advantage of an onboard programmer/debugger is that users do not have to buy an extra programmer/debugger hardware.

## 3.3 BLE Pioneer Kit USB Connection

The BLE Pioneer Kit powers from a computer over the USB interface (J13). It enumerates as a composite device, as shown in [Table 3-1](#). USB drivers required for this enumeration are part of the kit installer. The kit should be installed properly for its correct operation.

Visit [www.cypress.com/CY8CKIT-042-BLE](http://www.cypress.com/CY8CKIT-042-BLE) for the latest kit installer.

Table 3-1. BLE Pioneer Kit Enumerated Interfaces

Port	Description
USB Composite Device	Composite device
USB Input Device	USB-I <sup>2</sup> C bridge, KitProg command interface
KitProg	USB-I <sup>2</sup> C bridge, programmer, and debugger
KitProg USB-UART	USB-UART bridge, which appears as a COM# port

Figure 3-4. KitProg Driver Installation (appearance may differ depending on Windows version)

### 3.4 Placing PSoC 4 BLE Module on Baseboard

Plug the module into the BLE Pioneer Baseboard on headers J10 and J11, while keeping the antenna directed outside. Note that the two parallel headers J10 and J11 are not equal (24-pin and 20-pin, respectively) and will not allow the module to be inserted in the opposite direction.

Figure 3-5. Baseboard with J10 and J11 Headers to Connect PSoC 4 BLE Module

To remove the PSoC 4 BLE Module from the BLE Pioneer Kit, hold the BLE Pioneer Kit in one hand and the module in the other, as shown in [Figure 3-6](#), and pull it out using a rocking motion.

Figure 3-6. Remove Module Connected on BLE Pioneer Kit

## 3.5 Programming and Debugging BLE Device

The BLE Pioneer Kit and BLE Dongle can be programmed and debugged using the KitProg. Before programming the device, ensure that PSoC Creator and PSoC Programmer are installed on the computer. See the section [Install Software on page 21](#) for more information.

### 3.5.1 Programming using PSoC Creator

1. Connect the BLE Pioneer Kit/BLE Dongle to the computer's USB port, as shown in [Figure 3-7](#).

Figure 3-7. Connect USB Cable to J13

2. Load the desired example project in PSoC Creator from **File > Open > Project/Workspace**.
3. Build the project by choosing **Build > Build <Project Name>** or **[Shift] [F6]**, as shown in [Figure 3-8](#).

Figure 3-8. Build an Example Project

4. If there are no errors during build, program the firmware by clicking the **Program** button on the tool bar or pressing **[Ctrl] [F5]**, as shown in [Figure 3-9](#). This will program the device on the BLE Pioneer Kit/BLE Dongle and it will be ready for use.

Figure 3-9. Programming Device From PSoC Creator

### 3.5.2 Debugging using PSoC Creator

For debugging the project using PSoC Creator, follow steps 1 to 5 from [Programming using PSoC Creator on page 29](#) followed by:

1. Click the **Debug** icon or press **[F5]**, as shown in [Figure 3-10](#).

Figure 3-10. Start Debug on PSoC Creator

2. When PSoC Creator opens in debug mode, use the buttons on the toolbar for debugging.

For more details on using the debug features, see the Cypress application note [Getting Started with PSoC 4 BLE](#).

### 3.5.3 Programming using PSoC Programmer

PSoC Programmer (3.26 or later) can be used to program existing hex files into both BLE Pioneer Kit or BLE Dongle. To do this, follow these steps.

1. Connect the BLE Pioneer Kit or BLE Dongle to a computer and open PSoC Programmer from **Start > All Programs > Cypress > PSoC Programmer <version> > PSoC Programmer <version>**.
2. Click the **File Load** button at the top left corner of the window. Browse for the desired hex file and click **Open**.

Figure 3-11. Select Hex File

3. Go to **File > Program** to start programming the kit with the selected file.

**Note:** If the hex file does not match the device selected, then PSoC Programmer will throw an error of device mismatch and terminate programming.

Figure 3-12. Program Hex File to Kit

4. When the programming is finished successfully, indicated by a PASS message on the status bar, the BLE Pioneer Kit/BLE Dongle is ready for use. Close PSoC Programmer.

### 3.6 Updating BLE Dongle for CySmart Central Emulation Tool

The BLE Dongle, provides a BLE Central mode capability using the CySmart Central Emulation Tool on the computer. The CySmart Central Emulation Tool on the PC is the interface with which to configure the BLE Dongle and analyze the data transferred after connecting with a BLE Peripheral.

The BLE Dongle works along with the CySmart Central Emulation Tool, as shown in [Figure 3-13](#). The CySmart Central Emulation Tool is installed as part of the BLE Pioneer Kit installation and can be opened from **Start > All Programs > Cypress > CySmart <version> > CySmart <version>**. The tool operation is explained in the user guide, which can be accessed from **Help > Help Topics**.

Figure 3-13. BLE Dongle Interface on CySmart Central Emulation Tool

If the BLE Dongle contains custom firmware on PRoC BLE, the original CySmart firmware can be programmed back to restore the CySmart functionality. It must be connected through the USB and enumerated as KitProg. To do this, follow these steps:

1. Connect the BLE Dongle to the USB port on the computer.
2. Open PSoC Programmer by going to **Start > All Programs > Cypress > PSoC Programmer <version> > PSoC Programmer <version>**.

3. Click the **File Load** button and browse to the location of the **BLE\_4\_2\_Dongle\_CySmart\_256K.hex** file. The hex file is located at:  
 <Install\_Directory>\CY8CKIT-042-BLE Kit\<version>\Firmware\BLE Dongle\Hex Files\
- Note:** If Cypress releases new versions of the CySmart Central Emulation Tool and the BLE Dongle firmware, then the CySmart Central Emulation Tool will display a message requesting to update the firmware, as shown in the following figures.

Figure 3-14. Update BLE Dongle Firmware with Hex from Latest Kit Installer

Choose the .hex file from the respective location and update the BLE Dongle firmware.

Figure 3-15. Open Hex File

4. Ensure the other settings match as shown in [Figure 3-15](#). Click the **Program** button to start programming. The status bar at the bottom of the PSoC Programmer window will show the programming status and the result (Pass/Fail).

Figure 3-16. Programming Hex File to Dongle

5. After programming is completed successfully, the BLE Dongle firmware is updated and can be used to connect to the CySmart Central Emulation Tool.

## 3.7 USB-UART Bridge

The KitProg on both the BLE Pioneer Baseboard and BLE Dongle acts as a USB-UART bridge. When connected to a computer, a device named **KitProg USB-UART** is available under **Ports (COM & LPT)** in the Device Manager. The UART lines between PSoC 4 BLE Module and KitProg are hard-wired onboard, with UART\_RX assigned to **P1\_4** and UART\_TX assigned to **P1\_5** on the PSoC 4 BLE device.

COM terminal software, such as Hyperterminal or TeraTerm, can be used to send and receive data. UART data sent from the PSoC 4 BLE device on the UART\_TX line will be received by the software. Data entered in the software will be received by PSoC 4 BLE on the UART\_RX line. Refer to the Advanced Topics section in [CY8CKIT-042 PSoC 4 Pioneer Kit User Guide](#) for more details.

[Table 3-2](#) lists the specifications supported by the USB-UART bridge.

Table 3-2. Specifications Supported by USB-UART Bridge

Parameter	Supported Values
Baud Rate	1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200
Data Bits	8
Parity	None
Stop Bits	1
Flow Control	None
File Transfer Protocols supported	Xmodem, 1K Xmodem, Ymodem, Kermit, and Zmodem (only speeds greater than 2400 baud)

## 3.8 USB-I<sup>2</sup>C Bridge

The KitProg can function as USB-I<sup>2</sup>C bridge and communicate with the Bridge Control Panel (BCP) software utility. When connected to BCP, the **KitProg<serial number>** is available under **Connected I<sup>2</sup>C/SPI/RX8 Ports** in the BCP. The I<sup>2</sup>C connection between PSoC 4 BLE device and KitProg is used to transfer data between BCP and the PSoC 4 BLE device. The I<sup>2</sup>C lines on PSoC 4 BLE device are **P3\_4 (SDA)** and **P3\_5 (SCL)**, which are hard-wired onboard to I<sup>2</sup>C lines of KitProg. The USB-I<sup>2</sup>C supports I<sup>2</sup>C speed of 50 kHz, 100 kHz, 400 kHz and 1 MHz.

BCP is installed as part of the PSoC Programmer installation and can be accessed from **Start > All Programs > Cypress > Bridge Control Panel**. Refer to the Advanced section in the [CY8CKIT-042 PSoC® 4 Pioneer Kit User Guide](#) for more details.

To use the USB-I<sup>2</sup>C functionality, select the **KitProg<serial number>** in the BCP. On successful connection, the **Connected** and **Powered** status box turn green, as shown in [Figure 3-17](#).

Figure 3-17. KitProg USB-I<sup>2</sup>C Connected in Bridge Control Panel

### 3.9 Updating the KitProg Firmware

The KitProg firmware normally does not require any update. If an update is required, then PSoC Programmer will display a warning message when the kit is connected to it, as shown in [Figure 3-18](#).

Figure 3-18. Update KitProg

To update the KitProg, go to the **Utilities** tab on PSoC Programmer and click **Upgrade Firmware**, as shown in [Figure 3-19](#).

Figure 3-19. Update KitProg from PSoC Programmer

# 4. Example Projects

This chapter demonstrates the functionality of the PSoC 4 BLE device using the BLE Pioneer Kit example projects. Download and install the kit setup file from the [kit web page](#). The example projects can be accessed on the Start Page of PSoC Creator under **Examples and Kits**.

## 4.1 Using Example Projects

Follow these steps to open and use the example projects:

1. Launch PSoC Creator from **Start > All Programs > Cypress > PSoC Creator 4.1 > PSoC Creator 4.1**.
2. On the **Start** page, click on **CY8CKIT-042-BLE** under **Start > Kits**. A list of code examples appears, as shown in [Figure 4-1](#).
3. Click the desired example project.

Figure 4-1. Open Example Project from PSoC Creator

4. Select the folder where you want to save the project and click **OK**.

5. Every BLE project use a public address set in the BLE Component GUI to advertise and scan, depending on the role: Peripheral or Central mode. If multiple kits in close proximity have the same public address, then wrong devices may be connected or connections may fail. To prevent this, change the **Public address** (and preferably **Device name**) in the BLE Component **GAP Settings** tab as shown in Figure 4-2. Click **OK**.

Alternatively, you can select the 'Silicon generated' device address by selecting the check box. This way, the Bluetooth device (BD) address is generated using the silicon ID, unique to each device. Click **OK**.

Figure 4-2. Change BLE Public Address and Name

6. Build the example project by choosing **Build > Build <Project Name>**, as shown in Figure 4-3. A hex file will be generated.

Figure 4-3. Build Project from PSoC Creator

7. Connect the BLE Pioneer Baseboard to the computer through the USB Mini-B connector J13. Ensure that the PSoC 4 BLE module is placed on the baseboard.
8. Choose **Debug > Program** in PSoC Creator, as shown in [Figure 4-4](#).

Figure 4-4. Program Device in PSoC Creator

9. If the device is not yet acquired, PSoC Creator will open the programming window. Select **KitProg** and click the **Port Acquire** button, as shown in [Figure 4-5](#).

**Note:** The serial ID starting with 'BLE' belongs to the BLE Dongle (see [Updating BLE Dongle for CySmart Central Emulation Tool on page 32](#)).

Figure 4-5. Port Acquire

10. After the device is acquired, it is shown in a structure below the KitProg. Click the **Connect** button and then **OK** to exit the window and start programming, as shown in [Figure 4-6](#).

Figure 4-6. Connect Device From PSoC Creator and Program

This document refers to the BLE Pioneer Kits, BLE Dongle, and PC/mobile as Central or Peripheral devices. A Central device is normally the master and requests/commands data from the Peripheral device. BLE-enabled phones and computers are one such example. Peripheral devices store the actual data and send it to the Central device when requested. Examples include BLE-enabled sensors, proximity beacons, and so on.

If you are a beginner in BLE, refer to the PSoC Creator code examples such as `BLE_FindMe` and `BLE_Device_Information_Service` as pointed out in section 1.3.1. You may also refer the application note [Getting Started with PSoC 4 BLE](#).

The four Kit code examples viz. CapSense Slider and LED, CapSense Proximity, BLE Central Mode and Eddystone are intermediary level examples that will help to design a system around the kit. Refer to the [4.2 CapSense Slider and LED](#) and later for details.

The CySmart Dongle code example is an advanced level example that will demonstrate a complete solution around the kit. Refer to [4.6 BLE Dongle and LED Control](#) for details.

## 4.2 CapSense Slider and LED

### 4.2.1 Project Description

This project demonstrates connectivity between the BLE Pioneer Kit (acting as a Peripheral and GATT server device) and CySmart Central Emulation tool or mobile device running the CySmart mobile application (acting as a Central and GATT client device). This project demonstrates the following:

- Advertisement with timeout
- Connection with any Central device
- Two custom services in single profile
- Data transfer over BLE custom service using notifications, read, and write
- Low-power mode implementation for coin-cell operation

The BLE profile in this project consists of two BLE custom services: CapSense and RGB LED. The **CapSense service** consists of one custom characteristic, termed as CapSense Slider. The CapSense slider characteristic is used to send one byte data, ranging from 0 to 100, as notification to the GATT client device. This data is the finger location read by the CapSense Component on the five-segment slider (CSS1) present on the kit. This characteristic supports notification, which allows the GATT server to send data to the connected client device whenever new data is available.

The **RGB LED service** also consists of one custom characteristic, termed as RGB LED Control. This characteristic supports two operations, read and write, through which the connected GATT client device can read data as well as write a new value to the characteristic. This data has four byte values indicating red, green, blue, and the intensity values to control the onboard RGB LED.

The properties for the custom service/characteristics are configured in the BLE Component under the Profiles tab, as shown in [Figure 4-7](#).

Figure 4-7. Attributes Configuration in BLE Component for Custom Services

The project consists of the following files:

- **main.c.h**

These files contain the main function, which is the entry point and execution of the firmware application. They also contain the function definition for initialization of the system and reading the CapSense slider data from the CapSense Component.

- **BLEApplications.c.h**

These files contain all the macros and function definitions related to BLE communication and operation. They include the event callback function definition that is registered with the BLE Component startup and used to send BLE-related events from the BLE stack to the application layer for processing. These files contain a method to send CapSense notifications to the GATT client device and process the Read and Write commands on the RGB LED characteristic by the GATT client device. They update the BLE Connection parameter, which is important for low-power mode usage.

- **HandleLowPower.c.h**

These files contain the function to handle low-power mode. This function is continuously called in the main loop and is responsible for pushing the BLE hardware block (BLESS) as well as the CPU to Deep Sleep mode as much as possible. The wakeup source is either the BLE hardware block link layer internal timer or the interrupt from the user button press (**SW2**). This allows for very low power mode implementation and operation using a coin cell.

This is the default firmware that comes in the PSoC 4 BLE Module shipped with the kit.

Figure 4-8. TopDesign for PSoC\_4\_BLE\_CapSense\_Slider\_LED Project

## 4.2.2 Hardware Connections

No specific hardware connections are required for this project because all connections are hardwired on the BLE Pioneer Baseboard.

The pin assignment for this project is in **PSoC\_4\_BLE\_CapSense\_Slider\_LED.cydwr** in the Work-space Explorer, as shown in [Figure 4-9](#).

Figure 4-9. Pin Selection for CapSense Slider and LED Project

	Name	/	Port	Pin	Lock
█ \CapSense:Cmod\ (Cmod)			P4 [0]	5	<input checked="" type="checkbox"/>
█ \CapSense:Sns[0]\ (LinearSlider0_e0_LS)			P2 [1]	38	<input checked="" type="checkbox"/>

█ User_Button			P2 [7]	44	<input checked="" type="checkbox"/>

### 4.2.3 Flow Chart

Figure 4-10 shows the flow chart of the code implemented.

Figure 4-10. CapSense Slider and LED Project Flow Chart

## 4.2.4 Verify Output

The project can be verified by two methods: using the CySmart Central Emulation Tool and BLE Dongle or using the CySmart mobile application.

### 4.2.4.1 CySmart Central Emulation Tool

To verify the CapSense and LED project using the CySmart Central Emulation Tool, follow these steps:

**Note:** Refer [CySmart Central Emulation tool](#) to learn how to use the tool.

1. Connect the BLE Dongle to one of the USB ports on the computer.
2. Start the CySmart Central Emulation Tool on the computer by going to **Start > All Programs > Cypress > CySmart <version> > CySmart <version>**. You will see a list of BLE Dongles connected to it. If no dongle is found, click **Refresh**. Select the BLE Dongle and click **Connect**.

Figure 4-11. Connect to BLE Dongle

3. Place the PSoC 4 BLE Module on the BLE Pioneer Kit.
  4. Power the BLE Pioneer Kit through the USB connector **J13**.
  5. Program the BLE Pioneer Kit with the **PSoC\_4\_BLE\_CapSense\_Slider\_LED** example project. Follow steps in [Using Example Projects on page 37](#) to program the device.
  6. After programming successfully, press the user button (**SW2**) on the BLE Pioneer Kit to start the advertisement. Advertisement is indicated by a blinking red LED on the baseboard.
- Note:** The project has an advertisement timeout of 30 seconds after which it returns to Deep Sleep mode. Press **SW2** again to restart the advertisement.
7. On the CySmart Central Emulation Tool, click **Start Scan** to see the list of available BLE Peripheral devices.

8. Double-click the **Slider LED** device to connect, or click **Slider LED** and then click **Connect**.

Figure 4-12. Connect to BLE Slider and LED Peripheral

9. When connected, the CySmart Central Emulation Tool will display a message for the **Update connection parameters**. Select **Yes**, as shown in Figure 4-13.

Figure 4-13. Update Connection Parameter Option

**Note:** If you select **No**, the project will still work. However, the current consumption will be higher due to faster connection interval.

10. Click **Discover All Attributes** to find all attributes supported.

Figure 4-14. Discover All Attributes

11. Locate the attribute **Client Characteristic Configuration** descriptor (UUID 0x2902) under CapSense slider characteristic (UUID 0x0003CAA2-0000-1000-8000-00805F9B0131). Click **Read Value** to read the existing Client Characteristic Configuration Descriptor (CCCD) value as shown in Figure 4-15.

Figure 4-15. Read CCCD for CapSense Slider Characteristic

12. Modify the **Value** field of CCCD to '01:00' and click **Write Value**. This enables the notifications on the CapSense slider characteristic.

Figure 4-16. Write CCCD to Enable Notifications

13. Swipe your finger on the CapSense slider on the BLE Pioneer kit, as shown in [Figure 4-17](#) and see the notification values in the CapSense Slider value field, as shown in [Figure 4-18](#).

Figure 4-17. CapSense Slider

Figure 4-18. CapSense Slider Notification Received

Primary Service Declaration			
Handle	UUID	Description	Value
0x000C	0x2800	Primary Service Declaration	31:01:9B:5F:80:00:00:80:00:10
0x000D	0x2803	Characteristic Declaration	10:0E:00:31:01:9B:5F:80:00:00

0x000E	0003CAA200001000800000805F9B0131		FF		
0x000F	0x2902	Client Characteristic Configuration	00:00		
0x0010	0x2901	Characteristic User Description			
0x0011	0x2800	Primary Service Declaration	31:01:9B:5F:80:00:00:80		
0x0012	0x2803	Characteristic Declaration	1A:13:00:31:01:9B:5F:80		

15. Locate the **RGB LED Control** characteristic (**UUID 0x0003CBB1-0000-1000-8000-00805F9B0131**). Click **Read Value** to read the existing 4-byte onboard RGB LED color information, as shown in [Figure 4-20](#). The four bytes indicate red, green, blue, and the overall brightness, respectively.

Figure 4-20. Read RGB LED Control Characteristic Value

Primary Service Declaration			
Handle	UUID	Description	Value
0x0011	0x2800	Primary Service Declaration	31:01:9B:5F:80:00:00:80:00:10
0x0012	0x2803	Characteristic Declaration	1A:13:00:31:01:9B:5F:80:00:00
0x0013	0003CBB100001000800000805F9B0131	Characteristic Declaration	00:00:00:00
0x0014	0x2902	Client Characteristic Configuration	
0x0015	0x2901	Characteristic User Description	

16. Modify the four bytes of data in the **Value** field and click **Write Value**. You will see the corresponding change in the color and intensity of the RGB LED on the BLE Pioneer Kit, as shown in [Figure 4-21](#). The RGB LED will be on for 3 seconds before switching off to conserve power.

**Note:** If the kit is powered from a coin cell and not the USB Vbus, then the color mixing and intensity will vary. This is because the coin cell provides a lower driving voltage for RGB LEDs.

Figure 4-21. Write RGB LED Control Characteristic Value

The screenshot shows a BLE tool interface with the following details:

- Buttons:** Read Value, Write Value, Send Commands.

Figure 4-22. RGB LED Control with PSoC 4 BLE Module

17. To disconnect from the device, click **Disconnect**, as shown in Figure 4-23.

Figure 4-23. Disconnect from the Device

18. To connect to this peripheral again, restart advertising by pressing the user button (**SW2**) on the BLE Pioneer Kit. Advertising is indicated by the blinking red LED.

#### 4.2.4.2 CySmart Mobile Application

To verify the CapSense and LED project using the CySmart mobile application (refer [CySmart Mobile App webpage](#)), follow these steps:

1. Plug the PSoC 4 BLE Module on the BLE Pioneer Baseboard.
2. Connect the BLE Pioneer Kit into the computer using the J13 USB connector.
3. Program the kit with the **PSoC\_4\_BLE\_CapSense\_Slider\_LED** example project. See [Using Example Projects on page 37](#) for programming instructions.
4. Press the user button (**SW2**) on the BLE Pioneer Kit to start the advertisement. This is indicated by the blinking red LED on the BLE Pioneer Kit.
5. Open the application on the mobile device. If Bluetooth is not enabled on the device, the application will ask to enable it.
6. After Bluetooth is enabled, the CySmart mobile application will automatically search for available peripherals and list them. Select the **Slider LED** peripheral as shown in Figure 4-24.

Figure 4-24. Slider LED Peripheral

- When connected, the CySmart mobile application will list the profiles supported by the peripherals. Scroll and select the CapSense icon, as shown in [Figure 4-25](#).

Figure 4-25. CapSense Service Page

- Swipe your finger on the CapSense slider on the BLE Pioneer Kit and see a similar response on the **CapSense** page in the CySmart application ([Figure 4-26](#)).

Figure 4-26. CapSense Slider

- Press the back button to return to the service selection page. Scroll and tap on the RGB LED service.

10. On the RGB LED service page, swipe over the color gamut to see a similar color response on the BLE Pioneer Kit RGB LED. The slider below the color gamut controls the intensity of the RGB LED color. The RGB LED will be on for 3 seconds before switching off. This is done to conserve power.

Figure 4-27. RGB LED Control with CySmart Mobile Application

11. To disconnect from the BLE Pioneer Kit, return to the CySmart mobile application home screen by pressing the back button.
12. To reconnect to the Peripheral, press the user button (**SW2**) on the BLE Pioneer Kit again and then scan for devices using CySmart mobile application.

## 4.3 CapSense Proximity

### 4.3.1 Project Description

This project demonstrates connectivity between the BLE Pioneer Kit (acting as a Peripheral and GATT server device) and the CySmart Central Emulation Tool or mobile device running the CySmart mobile application (acting as a Central and GATT client device). This project demonstrates the following:

- Advertisement with timeout
- Connection with any Central device
- One custom service
- Data transfer over BLE custom service using notifications
- Low-power mode implementation for coin cell operation

The BLE profile in this project consists of a single BLE custom service, called CapSense. The **CapSense service** consists of a custom characteristic, termed as **CapSense Proximity**. The CapSense proximity characteristic is used to send one byte data, ranging from 0 to 255, as notification to the GATT client device. This data is the difference count read by the CapSense Component on the one-wire proximity sensor (J14) connected on the kit. This characteristic supports

notification, which allows the GATT server to send data to the connected GATT client device whenever new data is available.

The properties for the custom attributes are configured in the BLE Component under the Profiles tab, as shown in [Figure 4-28](#).

Figure 4-28. Attributes Configuration in BLE Component for CapSense Proximity

The project consists the following files:

■ **main.c.h**

These files contain the main function, which is the entry point and execution of the firmware application. They contain function definition for initialization of the system and reading the CapSense proximity data from the CapSense Component.

■ **BLEApplications.c.h**

These files contain all the macros and function definitions related to BLE communication and operation. They include the event callback function definition that is registered with the BLE Component startup and used to send BLE-related events from the BLE stack to the application layer for processing. These files contain a method to send CapSense notifications to the GATT client device. They update the BLE Connection parameter, which is important for low-power mode usage.

■ **HandleLowPower.c.h**

These files contain the function to handle low-power mode. This function is continuously called in the main loop and is responsible for pushing the BLE hardware block (BLESS) as well as the CPU to Deep Sleep mode as much as possible. The wakeup source is either the BLE hardware block link layer internal timer or the interrupt from the user button press (**SW2**). This allows for very low-power mode implementation and operation using a coin cell.

The red LED is used as the status LED and provides visual confirmation on advertising or connection states. A blinking red LED indicates advertising state.

Figure 4-29. Top Design for PSoC\_4\_BLE\_CapSense\_Proximity Project

#### 4.3.2 Hardware Connections

- Ensure that the PSoC 4 BLE module is placed on the baseboard.
- Connect a five-inch wire (provided as part of this kit) to the proximity connector J14 on the baseboard. Loop the wire as shown in [Figure 4-30](#).

**Note:** Ensure that the proximity sensor loop wire is kept away as much as possible from the BLE antenna on the PSoC 4 BLE Module.

Figure 4-30. Proximity Sensor Connection on BLE Pioneer Kit with PSoC 4 BLE Module

The pin assignment for this project is in **PSoC\_4\_BLE\_CapSense\_Proximity.cydwr** in the Work-space Explorer, as shown in [Figure 4-31](#).

Figure 4-31. Pin Selection for CapSense Proximity Project

	Name	/	Port	Pin	Lock
■ \CapSense:Cmod\ (Cmod)			P4 [0]	5	<input checked="" type="checkbox"/>
■ \CapSense:Sns\ (ProximitySensor0_0__PROX)			P2 [0]	37	<input checked="" type="checkbox"/>

■ User_Button			P2 [7]	44	<input checked="" type="checkbox"/>

### 4.3.3 Flow Chart

Figure 4-32 shows the flow chart of code implemented.

Figure 4-32. CapSense Proximity Project Flow Chart

#### 4.3.4 Verify Output

The project can be verified by two methods: using the CySmart Central Emulation Tool and BLE Dongle or using the CySmart iOS/Android app.

##### 4.3.4.1 CySmart Central Emulation Tool

To verify the CapSense Proximity project using the CySmart Central Emulation Tool, follow these steps:

**Note:** Refer [CySmart Central Emulation tool](#) to learn how to use the tool.

1. Connect the BLE Dongle to one of the USB ports on the computer.
2. Start the CySmart Central Emulation Tool on the computer by going to **Start > All Programs > Cypress > CySmart <version> > CySmart <version>**. You will see a list of dongles connected to it. If no dongle is found, click **Refresh**. Select the BLE Dongle and click **Connect**.

Figure 4-33. Connect to BLE Dongle

3. Connect a five-inch wire (included in the kit) to the proximity sensor connector J14 and make a loop of it.
  4. Power the BLE Pioneer Kit through the USB connector J13.
  5. Program the BLE Pioneer Kit with the **PSoC\_4\_BLE\_CapSense\_Proximity** example project. Follow the steps in [Using Example Projects on page 37](#) to program the device.
  6. After programming successfully, press the user button (**SW2**) on the BLE Pioneer kit to start the advertisement. This is indicated by a blinking red LED on the baseboard.
- Note:** The project has an advertisement timeout of 30 seconds after which it returns to Deep Sleep mode. Press **SW2** again to restart the advertisement.

7. On the CySmart Central Emulation Tool, click **Start Scan** to see the list of available BLE Peripheral devices.

Figure 4-34. Start Scanning

8. Double-click **CapSense Proximity** to connect or click **Connect** to connect to the BLE Pioneer Kit.

Figure 4-35. Connect to CapSense Proximity Peripheral

9. When connected, the CySmart Central Emulation Tool will display a message for the **Update connection parameters**. Select **Yes**, as shown in Figure 4-36.

Figure 4-36. Update Connection Parameter Option

**Note:** If you select **No**, the project will still work. However, the current consumption will be higher due to faster connection interval.

10. Click **Discover All Attributes** to find all attributes supported by the Peripheral.

Figure 4-37. Discover All Attributes

11. When all the attributes are listed, locate the **Client Characteristic Configuration** descriptor (UUID 0x2902) under CapSense Proximity characteristic (UUID 0x0003CAA1-0000-1000-8000-00805F9B0131). Click **Read Value** to read the existing CCCD value as shown in Figure 4-38.

Figure 4-38. Read CapSense Proximity CCCD

12. Modify the **Value** field to '01:00' and click **Write Value**. This enables the notifications on the CapSense proximity characteristic.

Figure 4-39. Write CCCD to Enable Notifications

Handle	UUID	UUID Description	Value
0x0005	0x2A01	Appearance	
0x0006	0x2803	Characteristic Declaration	02:07:00:04:2A
0x0007	0xA04	Peripheral Preferred Connection Parameters	
0x0008	0x2800	Primary Service Declaration	01:18 (Generic Attrb)
0x0009	0x2803	Characteristic Declaration	22:0A:00:05:2A
0x000A	0xA05	Service Changed	
0x000B	0x2902	Client Characteristic Configuration	
0x000C	0x2800	Primary Service Declaration	31:01:9B:5F:80:00:0
0x000D	0x2803	Characteristic Declaration	10:0E:00:31:01:9B:5
0x000E	0003CAA100001000800000805F9B0131		00
0x000F	0x2902	Client Characteristic Configuration	01:00
0x0010	0x2901	Characteristic User Description	

13. Bring your hand closer to the proximity sensor on the BLE Pioneer Kit, as shown in [Figure 4-40](#) and observe the value changing in the characteristic value field, as shown in [Figure 4-41](#).

Figure 4-40. CapSense Proximity Sensing with PSoC 4 BLE Module

Figure 4-41. CapSense Proximity Notification Received

Primary Service Declaration			
Handle	UUID	UUID Description	Value
0x000C	0x2800	Primary Service Declaration	31:01:9B:5F:80:00:0
Characteristic Declaration			
0x000D	0x2803	Characteristic Declaration	10:0E:00:31:01:9B:5
0x000E	0003CAA100001000800000805F9B0131		92
0x000F	0x2902	Client Characteristic Configuration	01:00
0x0010	0x2901	Characteristic User Description	

14. Modify the **Value** field of the Client Characteristic Configuration descriptor to '00:00' to disable notifications.

15. To disconnect from the device, click **Disconnect**, as shown in Figure 4-42.

Figure 4-42. Disconnect from the Device

16. Press user button (**SW2**) to wake up from sleep and restart the advertisement for the next connection.

#### 4.3.4.2 CySmart Mobile Application

To verify the CapSense Proximity project using the CySmart mobile application (refer [CySmart Mobile App webpage](#)), follow these steps:

1. Place the PSoC 4 BLE Module on the BLE Pioneer Baseboard.
2. Connect the five-inch wire as a loop to the proximity connector J14 on the baseboard.
3. Plug the BLE Pioneer Kit into the computer, using the J13 USB connector.
4. Program the kit with the **PSoC\_4\_BLE\_CapSense\_Proximity** example project. Follow steps in [Using Example Projects on page 37](#) to program the device.
5. Press the user button (**SW2**) on the BLE Pioneer Kit to start the advertisement.
6. Open the CySmart mobile application on the mobile device. If Bluetooth is not enabled on the device, the app will ask to enable it.
7. The app will automatically search for available peripherals and list them. Select the **CapSense Proximity** peripheral, as shown in Figure 4-43.

Figure 4-43. Connect to CapSense Proximity Peripheral

8. When connected, the app will list the services supported by the peripherals. Scroll and select the **CapSense Proximity** service.
9. When the CapSense service page opens, bring your hand near the sensor wire on the BLE Pioneer Kit and see a similar response in the app as a bar graph, as shown in [Figure 4-44](#).

Figure 4-44. CapSense Proximity Sensing with PSoC 4 BLE Module

10. To disconnect from the BLE Pioneer Kit, return to the device selection screen on the CySmart mobile application.
11. To reconnect to the Peripheral, press the user button (**SW2**) on the BLE Pioneer Kit to restart the advertisement and scan for the device in the CySmart mobile application.

## 4.4 BLE Central Mode

### 4.4.1 Project Description

The BLE projects described above have been functioning as Peripheral devices. This means that the firmware role was set to be a Peripheral and GATT server; another device such as the CySmart Central Emulation Tool or CySmart mobile application will connect to it and collect the data.

This example project demonstrates the Central and GATT client mode where it will scan for a Peripheral device, connect to it, and send commands. In this project, the BLE Pioneer Kit scans and auto-connects to a particular Peripheral device supporting **Immediate Alert Service (IAS)**. Whenever the Peripheral with a predetermined public address is found, a connection request is sent followed by discovering the attributes. When the discovery is over, you can send one of the three alert levels to the Peripheral device over the IAS. This is done by pressing the **SW2** button on the BLE Pioneer Kit and cycling through the alert levels.

The BLE Central project supports low-power mode operation, where the firmware supports BLE Hardware block and CPU Deep Sleep mode whenever possible. The system remains in Deep Sleep when disconnected. Press **SW2** to wake up the system and start scanning (blinking blue LED). The scanning timeout interval is set to 30 seconds. If a particular Peripheral device is found advertising before timeout, a connection is made (blue LED always ON). If no such device is found, then the

system stops scanning and returns to Deep Sleep mode (LED OFF). Press **SW2** again to wake the system and restart scanning.

To aid in evaluation, the Peripheral project with the particular public address is provided in the same workspace. This Peripheral project supports IAS and has fixed public address that the Central device will recognize and auto-connect to. The project should be programmed on the BLE Dongle and powered through the USB port of the computer. The received alert levels (No, Mid, and High alert) on the BLE Dongle are represented by different LED status. No Alert is represented by LED OFF, Mid Alert by blinking LED, and High Alert with LED always ON. Upon each successive button press on the BLE Pioneer Kit, the LED state on the BLE Dongle changes in a circular fashion.

The PSoC\_4\_BLE\_Central\_IAS demonstrates the BLE Central functionality on PSoC 4 BLE Module.

Additionally, the **BLE\_Dongle\_Peripheral\_IAS** project is to be programmed on the BLE Dongle. This project is present in both the PSoC\_4\_BLE\_Central\_IAS workspace and can be used to program the BLE Dongle separately.

**Note:** If the BLE Dongle is programmed with the **BLE\_Dongle\_Peripheral\_IAS** example, it will not work with the CySmart PC utility. Reprogram the BLE Dongle with the CySmart firmware according to [Updating BLE Dongle for CySmart Central Emulation Tool on page 32](#) to use the CySmart Central Emulation Tool.

Figure 4-45. PSoC\_4\_BLE\_Central\_IAS TopDesign

Figure 4-46. BLE\_Dongle\_Peripheral\_IAS TopDesign

#### 4.4.2 Hardware Connections

No specific hardware connections are required for this project because all connections are hardwired on the BLE Pioneer Baseboard.

BLE\_Dongle\_Peripheral\_IAS programs the BLE Dongle with Peripheral mode firmware.

The pin assignment for this project is in **PSoC\_4\_BLE\_Central\_IAS.cydwr** in the Workspace Explorer, as shown in Figure 4-47.

Figure 4-47. Pin Selection for BLE IAS Central Example Project

	Name	/	Port	Pin	Lock
	Status_LED		P3 [7]	54	<input checked="" type="checkbox"/>
	User_Button		P2 [7]	44	<input checked="" type="checkbox"/>

Similarly, the pin assignment for the BLE Dongle Peripheral project is in **BLE\_Dongle\_Peripheral\_IAS.cydwr** in the Workspace Explorer as shown in Figure 4-48.

Figure 4-48. Pin Selection for BLE IAS Peripheral Example Project

	Name	/	Port	Pin	Lock
	Alert_LED		P3 [3]	50	<input checked="" type="checkbox"/>

#### 4.4.3 Flow Chart

Figure 4-49 shows the flow chart for the IAS GATT client mode example project.

Figure 4-49. IAS GATT Client Mode Flow Chart

Figure 4-50 shows the flow chart for the IAS GATT server mode example project.

Figure 4-50. IAS GATT Server Mode Flow Chart

#### 4.4.4 Verify Output

1. Connect the BLE Dongle to one of the USB ports on the computer.

Figure 4-51. Connect BLE Dongle to USB Port

2. In the PSoC Creator Workspace Explorer, right-click the **BLE\_Dongle\_Peripheral\_IAS** project and select **Set As Active Project**, as shown in Figure 4-52.

Figure 4-52. Set Dongle Peripheral Project as Active

3. Program the BLE Dongle with the **BLE\_Dongle\_Peripheral\_IAS** project. Follow the steps described in [Using Example Projects on page 37](#).

**Note:** Do not update the public device address (inside the BLE Component) for the **BLE\_Dongle\_Peripheral\_IAS** example project. Changing the **BLE\_Dongle\_Peripheral\_IAS** example project public address will lead to no connection with the BLE Central device on the BLE Pioneer kit.

4. Power the BLE Pioneer Kit through USB connector **J13**.
5. In the Workspace Explorer, right-click the **PSoC\_4\_BLE\_Central\_IAS** project and select **Set As Active Project**, as shown in [Figure 4-53](#).

Figure 4-53. Set Central IAS Project as Active

6. Program the BLE Pioneer Kit with the **PSoC\_4\_BLE\_Central\_IAS** project.
7. Press the **SW2** button on the BLE Pioneer Kit to wake the system and start scanning. Scanning is indicated by a blinking LED.
8. Wait for the BLE connection between the BLE Dongle and the BLE Pioneer Kit. The connection success status is indicated on the baseboard in the following three stages:
  - a. Fast blinking blue LED represents scanning mode. During this mode, the BLE Pioneer Kit is scanning for Peripheral devices.
  - b. Slow blinking blue LED represents discovery mode. During this mode, the BLE Pioneer Kit has found the BLE Dongle Peripheral device and has started the connection procedure.
  - c. The blue LED remains on, representing the connected mode. This mode indicates that the Peripheral device is connected and the application can now send alert levels.

9. Press the **SW2** button on the BLE Pioneer Kit to send the next alert level to the BLE Dongle. The alert level will rotate from No Alert to Mid Alert to High Alert.

Figure 4-54. User Button on BLE Pioneer Kit with PSoC 4 BLE Module

10. Check if the LED behavior changes for each alert notification on the BLE Dongle according to the following table:

Alert Level	LED State
No Alert	LED Off
Mild Alert	LED Blinking
High Alert	LED On

**Note:** To revert the CySmart functionality to the dongle, program the dongle hex file, as described in [Updating BLE Dongle for CySmart Central Emulation Tool on page 32](#).

## 4.5 Eddystone

### 4.5.1 Project Description

This project demonstrates a BLE beacon based on Google's Eddystone™ protocol on the BLE Pioneer Kit. A beacon is a wireless device that broadcasts data (such as temperature) over a periodic radio signal from a known location. BLE-based beacons use the BLE advertisement packets to broadcast data. This project demonstrates the following:

- Beacon (non-connectable advertisement)
- Beacon configuration (connectable advertisement)

Google's Eddystone is a protocol that defines BLE advertisement data formats for beacons. In Eddystone parlance, the advertisement data is called a frame and the advertisement data format is called a frame type. The protocol supports multiple frame types that may be used individually or in combinations to create beacons for a variety of applications.

Figure 4-55. Characteristic Configuration in BLE Component for Eddystone Beacon

The BLE profile in this project consists of two BLE custom services, **Eddystone** and **Eddystone Configuration** (see [Figure 4-55](#)). The project broadcasts one of the following beacon frames in a non-connectable advertisement packet.

- **Eddystone-UID** frame broadcasts a unique 16-byte Beacon ID composed of a 10-byte namespace and a 6-byte instance. The Beacon ID may be useful in mapping a device to a record in external storage. The namespace portion of the ID may be used to group a particular set of beacons, while the instance ID identifies individual devices in the group. The division of the ID into namespace and instance components may also be used to optimize BLE scanning strategies, for example, by filtering only on the namespace. More details are available [here](#).
- **Eddystone-URL** frame broadcasts a URL using a compressed encoding format to fit more within the limited advertisement packet. More details are available [here](#).

- **Eddystone-TLM** frame broadcasts telemetry information about the beacon itself such as battery voltage, device temperature, and counts of broadcast packets. More details are available [here](#).

The Eddystone Configuration Service consists of nine characteristics as follows.

- **Lock State** – Read returns true if the device is locked.
- **Lock** – Locks the beacon and sets the single-use lock-code.
- **Unlock** – Unlocks the beacon and clears the single-use lock-code.
- **URI Data** – Reads/writes the URI.
- **URI Flags** – Reads/writes the flags.
- **Advertised Tx Power Levels** – Reads/writes the Advertised Power Levels array.
- **Tx Power Mode** – Reads/writes the TX Power Mode.
- **Beacon Period** – The period in milliseconds that an Eddystone-URL packet is transmitted.
- **Reset** – Resets to default values.

More details on the Eddystone Configuration service can be found [here](#).

The project consists of the following files:

- **main.c.h**

These files contain the main function, which is the entry point and execution of the firmware application. They contain function definitions for initialization and handling low power mode of the system. By default on power-on-reset, the system will do a non-connectable advertisement of URL/URI and TLM packets. When the **SW2** button is pressed, the device will enter connectable mode and various characteristics can be configured.

- **Eddystone.c.h**

These files contain the functions required to implement the Eddystone protocol including advertisement packet creation (for UID/URL and TLM), advertisement scheduling, and configuration read/write. The battery and temperature data are also updated before the TLM packets are constructed and advertised.

- **WatchdogTimer.c.h**

These files contain functions that provide necessary timing for the operation of the system.

- **Battery.c.h**

These files contain a function that will measure the battery voltage of the kit. This information is advertised as part of the TLM packets.

- **Temperature.c.h**

These files contain a function that will measure the die temperature of the PSoC device. An external sensor may be attached to measure ambient temperature. This information is advertised as part of the TLM packets.

The green LED indicates UID/URL packet transmissions, the blue LED indicates TLM packet transmissions, and the red LED indicates that the device is in connectable mode. In this mode, when connected, the beacon configuration can be modified.

PSoC\_4\_BLE\_Eddystone demonstrate this functionality on PSoC 4 BLE Module.

Figure 4-56. Top Design for PSoC\_4\_BLE\_Eddystone Project

#### 4.5.2 Hardware Connection

- Ensure that the PSoC 4 BLE module is placed on the baseboard.
- Connect a wire (provided as part of this kit) between VREF (connector J3) and P3.0 (connector J2) on the baseboard (see [Figure 4-57](#)).

Figure 4-57. VREF (J3) and P3.0 (J2) Connectors on BLE Pioneer Kit with PSoC 4 BLE Module

The pin assignment for this project is in *PSoC\_4\_BLE\_Eddystone.cydwr* in the Workspace Explorer, as shown in [Figure 4-58](#).

Figure 4-58. Pin Selection for Eddystone Project

	Name	Port	Pin	Lock
■	ConnectableState_LED	P2 [6]	43	✓
■	SW2	P2 [7]	44	✓
■	TLM_LED	P3 [7]	54	✓
■	URL_UID_LED	P3 [6]	53	✓
■	Vref	P3 [0]	47	✓

#### 4.5.3 Flow Chart

[Figure 4-59](#) shows the flow chart of code implemented.

Figure 4-59. Eddystone Project Flow Chart

#### 4.5.4 Verify Output

The project can be verified using an Android smart phone or an iOS device (iPhone or iPad). Before proceeding further make sure that a beacon application (such as Locate Beacon for Android or Chrome browser for iOS) and the CySmart app are installed on the smart phone/device. Also make sure that Bluetooth is turned on in the device, and you have a working internet connection.

To verify the Eddystone project in iOS, using Chrome for iOS browser, follow these steps. Before you start, make sure the Chrome browser for iOS is installed in your iOS device and the Chrome widget is added to the widgets view.

1. Place the PSoC 4 BLE Module on the BLE Pioneer Baseboard.
2. Power the BLE Pioneer Kit through the USB connector J13.
3. Program the BLE Pioneer Kit with the **PSoC\_4\_BLE\_Eddystone** example project. Follow steps in [Using Example Projects on page 37](#) to program the device.
4. After programming successfully, the firmware starts the non-connectable advertisement of UID/URL and TLM packets. Advertisement of UID/URL packets is indicated by the green LED and TLM packets is indicated by blue LED on the baseboard.
5. Pull down the notification area. You should be able to see the link in the notification area as shown in [Figure 4-60 on page 74](#).

Figure 4-60. iOS Notification Shade Showing the Beacon Advertised Web Link

6. Touching the link will take you to the website.

To verify the Eddystone project in Android devices using the Locate Beacon application, follow these steps.

1. Place the PSoC 4 BLE Module on the BLE Pioneer Baseboard.
2. Power the BLE Pioneer Kit through the USB connector J13.
3. Program the BLE Pioneer Kit with the **PSoC\_4\_BLE\_Eddystone** example project. Follow steps in [Using Example Projects on page 37](#) to program the device.
4. After programming successfully, the firmware starts the non-connectable advertisement of UID/URL and TLM packets. Advertisement of UID/URL packets is indicated by the green LED and TLM packets is indicated by blue LED on the baseboard.
5. Launch the **Locate** application on the smart phone/device.
6. Click the **Locate Beacons** button to start scanning for beacons (see [Figure 4-61](#)).

Figure 4-61. Locate Beacon App Home Screen

7. In the next screen a list of **Visible Beacons** will be displayed. Click the desired beacon (see [Figure 4-62](#)) to display its status and information (see [Figure 4-63](#)).

Figure 4-62. Locate Beacon App Showing Discovered Beacons

Figure 4-63. Locate Beacon Showing Details about Selected Beacon

To read and write characteristics (using an Android or iOS device, and CySmart app) of the beacon follow these steps.

1. Press **SW2** on the BLE Pioneer Kit baseboard to start the connectable advertisement. The advertisement state is indicated by the red LED.
2. Launch the CySmart app on your Android smart phone/device.
3. Connect to the **CY Eddystone** device from the list by clicking on it (see [Figure 4-64](#)).

Figure 4-64. CySmart App Showing the CY Eddystone Beacon

4. Click the **GATT DB** menu option (see [Figure 4-65](#)).

Figure 4-65. CySmart Showing GATT DB Option for CY Eddystone Device

5. Click on **Unknown Service** (see [Figure 4-66](#)) to see all available characteristics.

Figure 4-66. CySmart Showing Unknown Service in GATT DB

6. Click on any of the characteristics to read and modify it. For reference on Eddystone Configuration characteristics, refer to the [Google Eddystone page](#). To understand more about the CySmart app, refer to the [CySmart user guide](#).
7. Disconnect from the device to go back to the beacon mode.

## 4.6 BLE Dongle and LED Control

### 4.6.1 Project Description

This firmware supports the CySmart debug tool (refer [CySmart Central Emulation Tool](#)) by acting as the BLE host emulator. This is the default firmware that comes in the BLE Dongle shipped with the kit.

This project additionally demonstrates LED brightness control via a custom BLE profile, which works with the CapSense slider example explained in [CapSense Slider and LED on page 41](#).

The device will scan for the Peripheral, which acts as a CapSense slider and LED device, and connect to it automatically. This is achieved by filtering the advertisement packets for the CapSense slider service data. Then, it will enable slider notifications and process the received notifications. Whenever CapSense detects activity, it will notify the finger location to the BLE Dongle; it will update the LED brightness using PWM.

The custom GATT client LED control will be stopped if the CySmart Central Emulation Tool acquires the dongle. The dongle will enter the CySmart emulator mode, in which it will process all BLE commands as triggered by the user via the tool. The project uses custom command/event protocol to exchange data between the CySmart Central Emulation Tool and the BLE device via a USB-CDC interface. It uses the Cypress USB-UART bridge functionality from the PSoC 5LP-based KitProg module.

**Note:** This project is meant only for the PRoC BLE device and works on the CY5677 CySmart BLE 4.2 USB Dongle hardware.

Figure 4-67. Top Design for BLE\_4\_2\_Dongle\_CySmart\_256K Project

#### 4.6.2 Hardware Connections

No specific hardware connections are required for this project because all connections are hardwired on the BLE Dongle.

The pin assignment for this project is in **BLE\_4\_2\_Dongle\_CySmart\_256K.cydwr** in the Work-space Explorer, as shown in [Figure 4-68](#).

Figure 4-68. Pin Selection for BLE Dongle Project

	Name	/	Port	Pin	Lock
█ \UART:rx_wake\			P1 [4]	32	<input checked="" type="checkbox"/>
█ \UART:tx\			P1 [5]	33	<input checked="" type="checkbox"/>
█ Led_Pin			P3 [3]	50	<input checked="" type="checkbox"/>
█ Pin_SuspendIndicator			P3 [2]	49	<input checked="" type="checkbox"/>
█ Pin_UserButton			P2 [6]	43	<input checked="" type="checkbox"/>

#### 4.6.3 Flow Chart

Figure 4-69. Flow Chart for BLE\_4\_2\_Dongle\_CySmart\_256K Project

#### 4.6.4 Verify Output

This project will be used when the CySmart Central Emulation Tool is invoked for testing other example projects. In addition, the LED control operation can be verified as follows.

1. Power the BLE Pioneer kit through the USB connector J13.
2. Program the BLE Pioneer kit with the **PSoC\_4\_BLE\_CapSense\_Slider\_LED** example project described in [CapSense Slider and LED on page 41](#).
3. Connect the BLE Dongle to one of the USB ports on the computer.
4. Program the BLE Dongle with the **BLE\_4\_2\_Dongle\_CySmart\_256K** project. See [Using Example Projects on page 37](#) for programming instructions.
5. Press the user button **SW2** on both the BLE Dongle and the BLE Pioneer Kit. The BLE Dongle will start scanning and the BLE Pioneer Kit will start advertising.
6. Wait for the BLE connection between the BLE Dongle and the BLE Pioneer Baseboard. The connection success status will be indicated by a 3-second ON state of the red LED followed by the OFF state on the BLE Pioneer Baseboard.
7. Swipe your finger on the CapSense slider and check the LED brightness variation on the BLE Dongle.

### 4.7 Direct Test Mode (DTM)

#### 4.7.1 Project Description

[Bluetooth Core specification](#) (v4.0 and later), Volume 6, Part F defines Direct Test Mode (DTM) as a method to test the BLE PHY layer and provide a report back to the tester. It uses a **Host Controller Interface (HCI)** with a **two-wire UART** as the communication protocol.

The Device Under Test (DUT) is the BLE system that is to be tested (for example, BLE Pioneer Kit). With DTM, the RF performance of the BLE system can be verified during development or on a production line. The environment consists of the DUT and a tester. The tester has two parts; the **upper tester** sends commands through the HCI and the **lower tester** performs the corresponding action over the RF link. The tester compares the command sent over the HCI and the response received over RF, and provides a result of the performance.

Figure 4-70. Direct Test Mode (DTM) Setup

The BLE Component allows configuring the device in DTM by enabling the HCI. The appropriate responses to commands from the tester are performed by the BLE protocol stack and does not involve separate application handling. The only task required are to start the BLE Component and call the API to process the events.

The HCI is enabled in the BLE Component under the General settings. Note that when the HCI mode is selected, all other tabs are hidden and cannot be configured. This is because in HCI mode, there are no upper layer processes. On enabling HCI mode, the components automatically reserves a UART block to allow communication between the tester and BLE stack. The UART exposes the pins that can be assigned in `<project.cydwr>` file under the Pins tab. The only options to be configured for HCI mode are the baud rate and the pins for communication with the tester.

Figure 4-71. HCI Mode in BLE Component

Many companies develop BLE testers for Direct Test Mode. It is also possible to create PC-based software tools that will send HCI commands over serial communication links.

For PC-based software, the serial communication link is the COM port, which is enumerated by the KitProg on the PSoC 5LP of the BLE Pioneer kit. In such a case, the UART pins on the PSoC 4 BLE should be assigned to P1\_4 and P1\_5. These pins are hardwired to pins on the PSoC 5LP which allows USB-UART data communication between the PC-based software and the BLE device.

For external BLE testers, the serial communication is mostly over RS232. To test with that type of system, an external RS232 voltage translator is required, such as [Digilent's PmodRS232](#). This translator will modify the signal levels of the serial communication between the BLE device and the RS232 port on the tester. The UART pins of the BLE device can be assigned to P0\_0 and P0\_1 and header J5 can be used to connect to the RS232 translator.

Figure 4-72. J5 Header to Interface RS232 Translator

#### 4.7.2 Hardware Connection

For DTM test mode, it is recommended to use SMA connectors and connect the tester and DUT using an SMA to SMA connector cable. This ensures that there is minimum interference to RF communication between the DUT and tester, and the performance measured is the true RF performance of the device. The BLE Pioneer Kit module with SMA connector (CY8CKIT-141 PSoC 4 BLE) is available separately and can be ordered from the [Cypress web page](#).

Four UART pins are exposed when HCI mode is selected in the BLE Component. These pins should be assigned to allow communication with the external tester. The connection depends on the tester being used.

If the tester is PC-based software that communicates with HCI over a serial link, then the onboard PSoC 5LP on the BLE Pioneer Kit can act as the USB-UART bridge. The KitProg on the PSoC 5LP enumerates as a USB-UART interface and opens a COM port on the computer. This COM port is then used by the software tool to communicate commands to the BLE device. In this case, the UART pins should be assigned as follows.

Table 4-1. UART Pin Assignment for PC Software Tester

UART Pins	Pin Assigned
RX	P1_4
TX	P1_5
RTS	P1_6
CTS	P1_7

The UART for HCI communication exposes hardware flow control lines CTS and RTS. They can either be connected to the hardware control lines of the tester or CTS connected to ground for operation without hardware flow control.

If the tester is an external hardware tester (CBT), then connect any of the [RS232 voltage translators](#) to header J5 on the BLE Pioneer Kit. The UART pins should be assigned as follows.

Table 4-2. UART Pin Assignment for RS232 Voltage Translator

UART Pins	Pin Assigned
RX	P0_0
TX	P0_1
RTS	P0_2
CTS	P0_3

#### 4.7.3 Verify Output

1. Connect the BLE Pioneer Kit through the USB connector J13.
2. Program the BLE Pioneer Kit with the PSoC\_4\_BLE\_DTM project, as described in [Using Example Projects on page 37](#). Programming should complete successfully.
3. Connect the serial link, UART, or RS232 to the tester.
4. On the software tool for tester, configure the UART communication with the correct COM port and baud rate, as set in the BLE Component.
5. Start the test. The tool will generate the report after the end of the test. This depends on the tester/tool being used.

# 5. Hardware

This chapter describes the contents of the BLE Pioneer Kit hardware and its different blocks, such as the power block, USB connection, Arduino-compatible headers, module connectors, and CapSense slider.

The schematic and board layouts are available at the following location:

<Install\_Directory>\Cypress\CY8CKIT-042-BLE Kit\<version>\Hardware.

## 5.1 BLE Pioneer Baseboard

### 5.1.1 PSoC 5LP

An onboard PSoC 5LP contains the KitProg, which is used to program and debug the BLE device. The PSoC 5LP connects to the USB port of the computer through a USB Mini-B connector and to the SWD interface of the BLE device. PSoC 5LP is a true system-level solution providing MCU, memory, analog, and digital peripheral functions in a single chip. The CY8C58LPxx family offers a modern method of signal acquisition, signal processing, and control with high accuracy, high bandwidth, and high flexibility. The analog capability spans the range from thermocouples (near DC voltages) to ultrasonic signals.

For more information, visit the [PSoC 5LP web page](#).

See [Serial Interconnection between KitProg and Module on page 102](#) for more details.

### 5.1.2 Power System

The power supply system on the BLE Pioneer Baseboard is versatile, allowing the input supply to come from the following sources:

- 5-V power from the onboard USB connector
- 5-V to 12-V VIN power from the Arduino power header (J1)
- 3-V from the CR2032 coin cell

An adjustable LDO is used to output three different voltage levels (1.9 V, 3.3 V, and 5 V) to power the module. These voltages are selected with the J16 jumper, as shown in [Figure 5-1](#).

Figure 5-1. Schematics and Board Highlight of LDO and Power Selection Jumper

The input to the LDO can come from either the USB, the VIN pin in the Arduino header J1, or header J9.

**Note:** The typical dropout voltage of the selected LDO is 0.3 V at 500-mA output current. This gives a minimum output of 4.6 V from the input voltage of 5 V from the VBUS. This drop also considers the voltage drop across the Schottky diode connected at the output of the LDO to protect against voltage applied at the output terminal of the regulator.

The BLE Pioneer Baseboard also contains a CR2032 coin cell holder to power it using a coin cell, as shown in [Figure 5-2](#).

Figure 5-2. Schematics and Board Highlight of Coin Cell Holder

### 5.1.2.1 Protection Circuits

The power supply rail has reverse-voltage, overvoltage, short circuits, and excess current protection features, as shown in [Figure 5-3](#).

Figure 5-3. Power Supply Block Diagram With Protection Circuits

- A PTC resettable fuse is connected to protect the computer's USB ports from shorts and overcurrent.
- ORing diodes prevent damage to components when the BLE Pioneer Baseboard is powered from different voltage sources at the same time.
- ESD protection is provided for the USB Mini-B connector.

- A MOSFET-based protection circuit is provided for overvoltage and reverse-voltage protection for the 3.3-V rail from J1.5, as shown in [Figure 5-4](#).

Figure 5-4. Schematics and Board Highlight of MOSFET Protection Circuit for 3.3-V Rail from J1.5

### 5.1.2.2 Current Measurement Jumper

To demonstrate the low power consumption of PSoC 4 BLE Module, a two-pin header (J15) is populated in series with the power supply to the module. This can be used to measure current using an ammeter without the need to desolder any component from the BLE Pioneer Baseboard, as shown in [Figure 5-5](#).

Figure 5-5. Schematics and Board Highlight of Current Measurement Jumper

The following methods are supported for measuring the current consumption of the module.

- When the BLE Pioneer Baseboard is powered through the USB port (J13), remove jumper J15 and connect an ammeter, as shown in [Figure 5-6](#).

Figure 5-6. Current Measurement when Powered from USB Port

- When the BLE Pioneer Baseboard is powered from an external voltage supply, remove the USB cable from J13. Connect the positive terminal of the external voltage supply to the positive terminal of the ammeter and the negative terminal of the ammeter to the upper pin of J15. Connect the negative terminal of the external voltage supply to an onboard GND pin. [Figure 5-7](#) shows the required connections.

Figure 5-7. Current Measurement when Powered Separately

To measure the power consumption of only the module with coin cell, connect the coin cell directly to the PSoC 4 BLE Module, as shown in [Figure 5-8](#). The BLE Pioneer Baseboard is designed with additional circuits to protect the BLE device and the F-RAM in an Arduino environment. Note that power consumption measurements on the BLE Pioneer Baseboard will also include the power consumed by these additional circuits.

Connect the positive terminal of the coin cell to pin J2.2 and negative terminal to pin J2.4 using wires.

Figure 5-8. Powering the Module using a Coin Cell

### 5.1.3 Programming Interface

The BLE Pioneer Kit allows you to program and debug the PSoC 4 BLE in two ways:

- Using the onboard KitProg
- Using a CY8CKIT-002 MiniProg3 programmer and debugger

### 5.1.4 Expansion Connectors

#### 5.1.4.1 Arduino-Compatible Headers (J1, J2, J3, J4, and J12-unpopulated)

The BLE Pioneer Kit has five Arduino-compatible headers: J1, J2, J3, J4, and J12, as shown in [Figure 5-9](#). You can develop applications based on the Arduino shield's hardware.

Figure 5-9. Arduino Headers

The J1 header contains I/O pins for reset, I/O reference voltage (IOREF), and power supply line. The J2 header is an analog port that contains I/O pins for SAR ADC, comparator, and opamp. The J3 header is primarily a digital port that contains I/O pins for PWM, I<sup>2</sup>C, SPI, and analog reference. The J4 header is also a digital port that contains I/O pins for UART and PWM. The J12 header is an Arduino ICSP-compatible header for the SPI interface and is not populated. Refer to the “No Load Components” section of [Bill of Materials \(BOM\) on page 115](#) for the header part number.

**Note:** Take care when powering the Arduino shields via Arduino-compatible power header (J1). The V3.3 pin will output 5 V when the board is powered from USB/VIN and the system power supply jumper (J16) is set to 5 V operation.

### Additional Functionality of Header J2

The J2 header is a 6x2 header that supports Arduino shields. The Port 2 and Port 3 pins of PSoC 4 BLE are brought to this header. The Port 2 pins also connect to the onboard CapSense slider through 560-ohm resistors. When the CapSense feature is not used, remove these resistors to help ensure better performance with these pins.

#### 5.1.4.2 Pmod Connector - Digilent Pmod Compatible (J5-unpopulated)

This port supports Digilent Pmod modules (see [Figure 5-10](#)). Pmods are small I/O interfaces that connect with the embedded control boards through either 6- or 12-pin connectors. The BLE Pioneer Kit supports the 6-pin Pmod Type 2 (SPI) interface. For Digilent Pmod cards, go to [www.digilentinc.com](http://www.digilentinc.com).

This header is not populated on the BLE Pioneer Baseboard. You must populate this header before connecting the Pmod daughter cards. Refer to the “No Load Components” section of [Bill of Materials \(BOM\) on page 115](#) for the header part number.

Figure 5-10. Schematics and Board Highlight of Pmod Connector

### 5.1.4.3 PSoC 5LP GPIO Header (J8)

An 8x2 header is provided on the BLE Pioneer Baseboard to pull out several pins of PSoC 5LP to support advanced features such as a low-speed oscilloscope and a low-speed digital logic analyzer (see [Figure 5-11](#)). This header also contains the USB-Serial interface pins that can be used when these pins are not accessible on the Arduino headers because a shield is connected.

**Note:** You can use PSoC 5LP for your own custom firmware.

Figure 5-11. Schematics and Board Highlight of PSoC 5LP GPIO Expansion Header

### 5.1.5 USB Mini-B Connector

The PSoC 5LP connects to the USB port of a computer through a Mini-B connector (see [Figure 5-12](#)), which can also be used to power the BLE Pioneer Baseboard. A resettable polyfuse is used to protect the computer's USB ports from shorts and overcurrent. If more than 500 mA is drawn from the USB port, the fuse will automatically break the connection until the short or overload is removed.

Figure 5-12. Schematics and Board Highlight of USB Mini-B Connector

## 5.1.6 CapSense Circuit

### 5.1.6.1 CapSense Slider

The BLE Pioneer Kit has a five-segment linear capacitive touch slider, which is connected to the PSoC 4 BLE Module pins (see [Figure 5-13](#)). The CMOD and CTANK capacitors are required for CapSense functionality and are provided on the PSoC 4 BLE Module (see [Module Board on page 104](#)). A 2.2-nF capacitor is present on the CMOD pin, P4[0], for CapSense operation. BLE Pioneer Kit also supports CapSense designs that enable waterproofing. The connection of the shield to the pin or to ground is made by resistors R12 and R13, respectively. By default, R13 is mounted on the BLE Pioneer Baseboard, which connects the shield to ground. Populate R12 and remove R13 when evaluating waterproofing designs, which will connect the shield to the designated pin, P1[6].

Figure 5-13. Schematics and Board Highlight of CapSense Slider and Shield Setting

### 5.1.6.2 Proximity Header

The BLE Pioneer Baseboard contains a header (J14) for CapSense proximity wire connection (see [Figure 5-14](#)).

Figure 5-14. Schematics and Board Highlight of Proximity Header

### 5.1.7 BLE Pioneer Baseboard LEDs

The BLE Pioneer Baseboard has three LEDs. A green LED (LED2) indicates the status of the programmer. An amber LED (LED1) indicates the status of power supplied to the board. The BLE Pioneer Kit also has a general-purpose tricolor LED (LED3) for user applications. These are connected to P2\_6 (red LED), P3\_6 (green LED) and P3\_7 (blue LED). [Figure 5-15](#) and [Figure 5-16](#) show the schematics of these LEDs.

Figure 5-15. Schematics of Status and Power LED

Figure 5-16. Schematics and Board Highlight of RGB LED

### 5.1.8 Push-Buttons

The BLE Pioneer Baseboard contains a reset push-button and a user push-button, as shown in [Figure 5-17](#). The reset button is connected to the XRES pin of BLE device and is used to reset it. The user button is connected to P2[7] of the BLE device. Both the buttons connect to ground on activation (active low).

Figure 5-17. Schematics and Board Highlight of Reset Button and User Button

### 5.1.9 Cypress Ferroelectric RAM (F-RAM)

The BLE Pioneer Baseboard contains the FM24V10-G F-RAM device (see [Figure 5-18](#)), which can be accessed through I<sup>2</sup>C lines P5[0] and P5[1] of the PSoC 4 BLE Module. The F-RAM is 1-Mbit (128KB) with an I<sup>2</sup>C speed up to 1 Mbps. The I<sup>2</sup>C slave address of the F-RAM device is seven bits wide, and the LSB two bits are configurable through physical pins and are hardwired to 00 on the board. By default, the address of the F-RAM device used on the BLE Pioneer Baseboard is 0x50. This address can be modified by changing the R32/R36 and R33/R37 pairs. The operating voltage range of the F-RAM is between 2 V and 3.6 V. To prevent the application of 5 V from the adjustable LDO regulator on the BLE Pioneer Baseboard, a MOSFET-based protection circuit similar to the one used for the 3.3-V rail is connected between the output of the regulator and the VDD pin of the F-RAM. The protection circuit cuts off the power to the F-RAM when the output of the regulator is greater than 3.6 V.

Figure 5-18. Schematics and Board Highlight of F-RAM

### 5.1.10 Serial Interconnection between KitProg and Module

The KitProg is also a USB-Serial interface. It supports USB-UART and USB-I<sup>2</sup>C bridges (see [Figure 5-19](#)). The pull-up resistors on the I<sup>2</sup>C bus are enabled when the protocol is selected from the user interface (such as Bridge Control Panel). The USB-Serial pins of the KitProg are also available on the Arduino header; therefore, it can be used to control Arduino shields with the SPI/I<sup>2</sup>C/UART interface. Refer [USB-UART Bridge on page 34](#) and [USB-I<sup>2</sup>C Bridge on page 35](#) for more information on how to use these serial interconnections.

Figure 5-19. Schematics and Board Highlight of Serial Interface and I<sup>2</sup>C Pull-Up via FET

### 5.1.11 Module Headers

The PSoC 4 BLE Module is connected to the BLE Pioneer Baseboard using the two (24-pin and 20-pin) module headers, as shown in [Figure 5-20](#).

Figure 5-20. Schematics and Board Highlight of Module Headers

For information on how to add these on your own board, refer to [Adding BLE Module-Compatible Headers on Your Baseboard on page 123](#).

## 5.2 Module Board

### 5.2.1 PSoC 4 BLE Device

The PSoC 4 BLE device is the main component on the module. It provides the RF interface and analog and digital capability. The PSoC 4 BLE pins are mapped to the module headers (see Figure 5-21). For more information, refer to the [BLE web page](#).

See [BLE Modules and BLE Dongles Compatible with the BLE Pioneer Kit](#) on page 125 for details.

Figure 5-21. Schematics and Board Highlight of Module Headers for BLE Pins

### 5.2.2 Module Power Connections

The PSoC 4 BLE module has three power domains: VDDD, VDDA, and VDDR. The VDDD connection supplies power for digital device operation, VDDA supplies power for analog device operation, and VDDR connection supplies power for the device radio. By default, these domains are shorted using a 330-ohm, 100-MHz ferrite bead. The domains are shorted for standalone usage scenarios of module, such as programming the module using MiniProg 3 or using the module as a standalone data acquisition unit.

It is recommended to place the ferrite bead between the supply to avoid ripple between VDDR and the other two domains. If the supply ripple is less than 100 mV, these can be changed to a zero-ohm resistor.

Figure 5-22. Schematics and Board Highlight of Ferrite Bead and Power Pin

### 5.2.3 Module Headers (20-Pin and 24-Pin Headers)

The PSoC 4 BLE Module connects to the BLE Pioneer Baseboard using two (20-pin and 24-pin) module headers (Figure 5-23). All GPIOs and power domains are brought out to these headers. These headers are the counterparts of the connectors in [Expansion Connectors on page 93](#).

Figure 5-23. Schematics and Board Highlight of Headers

#### 5.2.4 Wiggle Antenna

PSoC 4 BLE module uses the wiggle antenna. Refer to the Antenna Design Guide ([AN91445](#)) for details.

Figure 5-24. Board Highlight of Wiggle Antenna

## 5.2.5 Antenna Matching Network

An Antenna Matching Network is required between the BLE device and the antenna to achieve optimum performance ([Figure 5-25](#)). The matching network has four main tasks:

- Transform the balanced output of the radio to an unbalanced connection to the antenna (balun).
- Transform the output impedance of the radio to a 50-ohm antenna.
- Suppress harmonics to a level below the regulations level in TX mode.
- Suppress the local oscillator (LO) leakage in RX mode.

Figure 5-25. Schematics and Board Highlight of Antenna Matching Network and Antenna

## 5.2.6 BLE Passives

Module boards include a 24-MHz crystal and a 32-kHz crystal, the CMOD and shield (CTANK) circuit for CapSense, a SAR bypass capacitor, and adequate decoupling capacitors for all the power domains, as shown in [Figure 5-26](#).

Figure 5-26. Schematics and Board Highlight – External Crystal, CMOD, CTANK, Decaps, Jumpers

### 5.2.7 Test Points

All power domains are brought out as test points for easy probing.

## 5.3 BLE Dongle Board

See [PSoC 4 BLE Device on page 104](#) for schematics of PRoC BLE pins. The pinout for PSoC 4 BLE and PRoC BLE are identical.

See [Wiggle Antenna on page 107](#) for schematics of wiggle antenna.

See [Antenna Matching Network on page 108](#) for schematics of antenna matching network.

See [BLE Pioneer Baseboard LEDs on page 99](#) for schematics of power and status LED.

See [Push-Buttons on page 100](#) for schematics of push-buttons.

Figure 5-27. Board Highlight

### 5.3.1 Power System

The BLE Dongle is powered directly using 5 V from the USB port, as shown in Figure 5-28.

Figure 5-28. Power Supply Block Diagram With Protection Circuits

### 5.3.1.1 Protection Circuits

The PTC resettable fuse is connected to protect the computer's USB ports from shorts and overcurrent.

### 5.3.2 USB Type-A Plug

The KitProg on the BLE Dongle connects to the USB port of a computer through a USB Type-A plug ([Figure 5-29](#)). The BLE Dongle is powered using the same plug. A resettable polyfuse is used to protect the computer's USB ports from shorts and overcurrent. If more than 500 mA is applied to the USB port, the fuse will automatically break the connection until the short or overload is removed. The VBUS, D+, and D– lines from the USB connector are also protected against ESD events using TVS diodes.

Figure 5-29. Schematics and Board Highlight of USB Type-A Plug

### 5.3.3 User LED

A user LED is provided to indicate status from the PRoC BLE device (Figure 5-30). It is also used to show the bind status.

Figure 5-30. Schematics and Board Highlight of User LED

# 6. Advanced Topics

This chapter describes the functionality of the FM24V10 F-RAM in the BLE Pioneer Kit.

## 6.1 Using FM24V10 F-RAM

The BLE Pioneer Baseboard has an onboard ferroelectric RAM chip that can hold up to 1 Mb of data. The chip provides an I<sup>2</sup>C communication interface for data access. It is hardwired to the I<sup>2</sup>C lines (P5\_0 and P5\_1). Because the F-RAM device is an I<sup>2</sup>C slave, it can be accessed or shared among various I<sup>2</sup>C masters on the same line. For more details on the F-RAM device, refer to the [device datasheet](#).

### 6.1.1 Address Selection

The slave address of the F-RAM device consists of three parts, as shown in [Figure 6-1](#): slave ID, device select, and page select. Slave ID is an F-RAM family-specific ID located in the datasheet of the particular F-RAM device. For the device used in the BLE Pioneer Baseboard (FM24V10), the slave ID is 1010b. Device select bits are set using the two physical pins A2 and A1 in the device. The setting of these two pins on the BLE Pioneer Baseboard is controlled by resistors R32/R36 (A1) and R33/R37 (A2). Because the memory location in F-RAM is divided into two pages of 64KB each, the page select bit is used to refer to one of the two pages in which the read or write operations will take place.

Figure 6-1. F-RAM I<sup>2</sup>C Address Byte Structure

### 6.1.2 Write/Read Operation

The device datasheet includes details on how to perform a write/read operation with the F-RAM. Figure 6-2 and Figure 6-3 provide a snapshot of the write/read packet structure as a quick reference.

Figure 6-2. F-RAM Single-Byte and Multiple-Byte Write Packet Structure

Figure 6-3. F-RAM Single-Byte and Multiple-Byte Read Packet Structure

As shown in the figures, all operations start with the slave address followed by the memory address. For write operations, the bus master sends each byte of data to the memory, and the memory generates an acknowledgement condition. For read operations, after receiving the complete slave address and memory address, the memory begins shifting data from the current address on the next clock.

# A. Appendix

## A.2 KitProg Status LED States

User Indication	Scenario	Action Required by user
LED blinks fast: Frequency = 4.00 Hz	LED starts blinking at power up, if bootloadable file is corrupt.	Bootload the <i>KitProg.cyacd</i> file: In PSoC Programmer, connect to the kit, open the <b>Utilities</b> tab, and press the <b>Upgrade Firmware</b> button.
LED blinks slow: Frequency = 0.67 Hz	Entered Bootloader mode by holding the Reset button of the BLE Pioneer Kit/BLE Dongle during kit power up.	Release the Reset button and replug power if you entered this mode by mistake. If the mode entry was intentional, bootload the new .cyacd file using the Bootloader Host tool shipped with PSoC Creator.
LED blinks very fast: Frequency = 15.0 Hz	SWD operation is in progress. Any I <sup>2</sup> C traffic. Kit's COM port connect/disconnect event (one blink).	In PSoC Programmer, watch the log window for status messages for SWD operations. In the Bridge Control Panel, the LED blinks on I <sup>2</sup> C command requests. In Bridge Control Panel or any other serial port terminal program, distinguish the kit's COM port number by the blinking LED when the port is connected or disconnected.
LED is ON.	USB enumeration successful. Kit is in the idle state waiting for commands.	The kit functions can be used by PSoC Creator, PSoC Programmer, Bridge Control Panel, and any serial port terminal program.
LED is OFF.	Power LED is ON.	This means that the USB enumeration was unsuccessful. This can happen if the kit is not powered from the USB host or the kit is not connected to the USB host through the USB cable. Verify the USB cable and check if PSoC Programmer is installed on the PC.

## A.3 Adding BLE Module-Compatible Headers on Your Baseboard

The baseboard should have a 20-pin header and a 24-pin header. Dimension of these connectors are given here.

Figure A-1. Connectors on BLE Pioneer Kit Baseboard

These headers are available for purchase from Digikey.

Description	Manufacturer	Manufacturer Part Number	Digikey Part Number
CONN HEADER 2.54MM 24POS GOLD	Sullins Connector Solutions	SBH11-PBPC-D12-ST-BK-ND	<a href="#">SBH11-PBPC-D12-ST-BK-ND</a>
CONN HEADER 2.54MM 20POS GOLD	Sullins Connector Solutions	SBH11-PBPC-D10-ST-BK	<a href="#">S9172-ND</a>

## A.4 Programming BLE Modules via MiniProg3

If the BLE Modules are to be used without the BLE Pioneer Baseboard, they can be programmed using MiniProg3. The J2 header has five adjacent pins – VDDD, GND, XRES, P0[7], and P0[6]. These pins can be used to program the BLE Module using MiniProg3.

Figure A-2. Programming a BLE Module via MiniProg3

Follow these steps to program the module:

1. Connect the MiniProg3 to the J2 connector, with the VDD of the MiniProg3 aligned to the VDDD on the module.
2. Click **Start > All Programs > Cypress > PSoC Programmer <version> > PSoC Programmer <version>**.
3. Open the desired .hex file in PSoC Programmer.
4. On the **Programmer** tab, set the **Programming Mode** to **Reset**.
5. Set **AutoDetection** to **On**.
6. Set **Programmer Characteristics > Protocol** to **SWD**.
7. Set **Programmer Characteristics > Voltage** to the desired value.
8. Click the **Toggle Power** icon below the menu bar to power the module.
9. Click the **Program** icon below the menu bar to program the module.

## A.5 BLE Modules and BLE Dongles Compatible with the BLE Pioneer Kit

Different BLE modules and BLE dongles can work with the BLE Pioneer Kit, as listed in the following tables.

BLE Module	Availability	Flash Size	Bluetooth Version
CY8CKIT-142 PSoC 4 BLE Module	As part of the kit	128KB	Bluetooth 4.1
CY8CKIT-141 PSoC 4 BLE SMA Module	Available separately	128KB	Bluetooth 4.1
CY8CKIT-143 PSoC 4 BLE 256KB Module	Available separately	256KB	Bluetooth 4.1
CY8CKIT-143A PSoC 4 BLE 256KB Module	Available separately	256KB	Bluetooth 4.2

  

BLE Dongle	Availability	Flash Size	Bluetooth Version
CY5677 CySmart BLE 4.2 USB Dongle (BLE Dongle)	Available separately	256KB	Bluetooth 4.2

### A.5.1 CY8CKIT-142 PSoC 4 BLE Module

This is the default PSoC 4 BLE Module shipped as part of the BLE Pioneer Kit (it can also be ordered separately). This module has the CY8C4247LQI-BL483 silicon, with 128KB flash and 16KB RAM.

Figure A-3. CY8CKIT-142 PSoC 4 BLE Module

#### A.5.2 CY8CKIT-141 PSoC 4 BLE SMA Module

This module is identical to the default PSoC 4 BLE Module, except that it has an SMA connector instead of a wiggle antenna; this connector can be used to connect to an external antenna. This module can be ordered separately.

Figure A-4. CY8CKIT-141 PSoC 4 BLE SMA Module

### A.5.3 CY8CKIT-143 PSoC 4 BLE 256KB Module

This is the higher flash equivalent of the PSoC 4 BLE Module. It has the CY8C4248LQI-BL483 silicon, with 256KB flash and 32KB RAM. It can be ordered separately.

Figure A-5. CY8CKIT-143 PSoC 4 BLE 256KB Module

### A.5.4 CY8CKIT-143A PSoC 4 BLE 256KB Module

This module is similar to the CY8CKIT-143 Module, but supports Bluetooth 4.2 features and DMA. It has the CY8C4248LQI-BL583 silicon, with 256KB flash and 32KB RAM. It can be ordered separately.

Figure A-6. CY8CKIT-143A PSoC 4 BLE 256KB Module

### A.5.5 CY5677 CySmart BLE 4.2 USB Dongle (BLE Dongle)

This is the higher flash equivalent of the default BLE Dongle. It has the CYBL11573-56LQXI silicon, with 256KB flash and 32KB RAM, and supports Bluetooth 4.2 and DMA. It can be ordered separately.

Figure A-7. CY5677 CySmart BLE 4.2 USB Dongle (BLE Dongle)

## A.6 Migrating Projects Across Different Pioneer Series Kits

All Cypress Pioneer series kits are Arduino Uno-compatible and have some common onboard peripherals such as RGB LED, CapSense, and a user switch. However, the pin mapping in each of the boards is different due to differences in pin functions of the PSoC device used. This guide lists the pin maps of the Pioneer series kits to allow easy migration of projects across different kits.

In some cases, the pins available on the Pioneer kit headers are a super set of the standard Arduino Uno pins. For example, J2 contains only one row of pins on the Arduino Uno pinout while it contains two rows of pins on many of the Pioneer series kits.

Figure A-8. Pioneer Series Kits Pin Map

### A.6.1 Arduino Uno-Compatible Headers

J1 Arduino-Compatible Header Pin Map					
Pin #	Arduino Pin	Pioneer Series Kits

Document Number: 001-93731				
Revision	ECN#	Issue Date	Origin of Change	Description of Change
*G (cont.)	5000725	12/23/2015	UDYG	<p>Updated Appendix chapter on page 115:</p> <p>Updated “BLE Modules and BLE Dongles Compatible with the BLE Pioneer Kit” on page 125:</p> <p>Updated tables.</p> <p>Added “CY8CKIT-143A PSoC 4 BLE 256KB Module” on page 126.</p> <p>Added “CY5676A PRoC BLE 256KB Module”.</p> <p>Added “CY5677 CySmart BLE 4.2 USB Dongle (BLE Dongle)” on page 127.</p>
*H	5135559	02/12/2016	UDYG	<p>Updated Example Projects chapter on page 37:</p> <p>Removed “Over-the-Air (OTA) Device Firmware Upgrade and Bluetooth 4.2 Features”.</p> <p>Updated “Migrating Example Projects from 128KB Flash Devices to 256KB Flash Devices”:</p> <p>Updated description.</p>
*I	5812144	07/27/2017	SAGA	<p>Removed “PRoC BLE” related information in all instances across the document.</p> <p>Replaced “CY5670 CySmart USB Dongle (BLE Dongle)” with “CY5677 CySmart BLE 4.2 USB Dongle (BLE Dongle)” in all instances across the document.</p>
				<p>Updated Introduction chapter on page 10:</p> <p>Updated description.</p> <p>Updated “BLE Pioneer Baseboard Details” on page 12:</p> <p>Updated description.</p> <p>Updated Figure 1-4.</p> <p>Updated “PSoC Creator” on page 14:</p> <p>Updated “PSoC Creator Code Examples” on page 15:</p> <p>Updated Figure 1-6.</p> <p>Updated “Additional Learning Resources” on page 18:</p> <p>Updated description.</p>
				<p>Updated Software Installation chapter on page 21:</p> <p>Updated “Install Software” on page 21:</p> <p>Updated description.</p> <p>Removed “Windows 8.1 USB Selective Suspend Setting”.</p> <p>Added “Windows 8.1 and Windows 10 USB Selective Suspend Setting” on page 24.</p>

## Document Revision History (*continued*)

Document Title: CY8CKIT-042-BLE Bluetooth® Low Energy (BLE) Pioneer Kit Guide

Document Number: 001-93731

Revision	ECN#	Issue Date	Origin of Change	Description of Change
*I (cont.)	5812144	07/27/2017	SAGA	<p>Updated Kit Operation chapter on page 25:            Updated “Theory of Operation” on page 25:            Updated description.            Updated “Placing PSoC 4 BLE Module on Baseboard” on page 28:            Replaced “Modules” with “PSoC 4 BLE Module” in heading.            Updated <a href="#">Figure 3-5</a> (Updated caption only).            Updated description.            Updated “Programming and Debugging BLE Device” on page 29:            Updated “Programming using PSoC Programmer” on page 31:            Updated description.            Updated <a href="#">Figure 3-11</a>, and <a href="#">Figure 3-12</a>.            Updated “Updating BLE Dongle for CySmart Central Emulation Tool” on <a href="#">page 32</a>:            Updated description.            Updated <a href="#">Figure 3-13</a>, <a href="#">Figure 3-14</a>, <a href="#">Figure 3-15</a>, and <a href="#">Figure 3-16</a>.            Removed figure “Update BLE Dongle Firmware with Hex from Web”.            Updated “USB-UART Bridge” on page 34:            Updated description.</p> <p>Updated Example Projects chapter on page 37:            Updated “Using Example Projects” on page 37:            Updated description.            Updated <a href="#">Figure 4-1</a>, <a href="#">Figure 4-2</a>, and <a href="#">Figure 4-5</a>.            Updated “CapSense Slider and LED” on page 41:            Updated “Project Description” on page 41:            Updated description.            Updated <a href="#">Figure 4-8</a>.            Updated “Verify Output” on page 45:            Updated “CySmart Central Emulation Tool” on page 45:            Updated description.            Updated <a href="#">Figure 4-11</a>.            Updated “CySmart Mobile Application” on page 50:            Updated description.</p>
